Describing Populations

Ecological Systems How do scientists study populations? Ecologists study a population's abundance, geographic range, growth rate, density, and distribution, and the environment.

Change after Change How does a population size change? Geographic range, abundance, density, and distribution change. For example, the population of bacteria in a flask doubles a certain time interval. How fast do all other populations grow? How fast do all other populations grow? How fast do all other populations grow?

Growth Rate The number of organisms in a population change over time, or a rate of growth. Population growth can occur rapidly under certain conditions, but it can also occur slowly under certain conditions.

Komodo Dragons James B. Murphy, Claudio Ciofi, Colomba de La Panouse, Trooper Walsh, 2015-03-31 More than twenty years have passed since Walter Auffenberg's monumental *The Behavioral Ecology of the Komodo Monitor* In the intervening years the populations of Komodo dragons native only to a handful of islands in southeast Indonesia have dwindled sparking intensive conservation efforts During the last two decades new information about these formidable predators has emerged and the most important findings are clearly presented here A memoir from Walter Auffenberg and his son Kurt is followed by the latest information on Komodo dragon biology ecology population distribution and behavior The second part of the book is dedicated to step by step management and conservation techniques both for wild and captive dragons This successful model is a useful template for the conservation of other endangered species as well for as Kurt and Walter Auffenberg note The species may well indeed survive in the wild for generations to come while countless other organisms are lost

Structured Population Models in Biology and Epidemiology Pierre Magal, Shigui Ruan, 2008-04-12 In this new century mankind faces ever more challenging environmental and public health problems such as pollution invasion by exotic species the emergence of new diseases or the emergence of diseases into new regions West Nile virus SARS Anthrax etc and the resurgence of existing diseases in uenza malaria TB HIV AIDS etc Mathematical models have been successfully used to study many biological epidemiological and medical problems and nonlinear and complex dynamics have been observed in all of those contexts Mathematical studies have helped us not only to better understand these problems but also to find solutions in some cases such as the prediction and control of SARS outbreaks understanding HIV infection and the investigation of antibiotic resistant infections in hospitals

Structured population models distinguish individuals from one another according to characteristics such as age size location status and movement to determine the birth growth and death rates interaction with each other and with environment infectivity etc The goal of structured population models is to understand how these characteristics affect the dynamics of these models and thus the outcomes and consequences of the biological and epidemiological processes There is a very large and growing body of literature on these topics This book deals with the recent and important advances in the study of structured

population models in biology and epidemiology There are six chapters in this book written by leading researchers in these areas
