Mrs. Côté

Answer Key

Enviro. Science 120

## Pre Lab Work:

Before beginning this laboratory, answer the following questions on your own piece of paper in your notebook:

- Define the following terms:
  - growth rate – describes how fast a population is increasing or decreasing and is dependent upon the birth rate and death rate
  - birthrate – is the number of infants born in a given year/1000 people in the population
  - death rate – is the number of people who die in a given year/1000 individuals in the population
  - zero population growth – when the population is in equilibrium or the number of births and deaths are equal
  - developed country – countries that highly developed economy and advanced technology
  - developing country – countries that are considered to have low standard of living, and undeveloped industrially
  - demographic transition – refers to the transition from high birth and death rates to low birth and death rates
- What is a population explosion? How quickly is our population growing each year? What about each day?  
A population explosion is when a population lacks limited resources so is able to grow out of control. The human population is grows about 80 million a year and 219, 178 each day.
- How is the growth rate of the human population calculated?  
 $\text{Growth rate} = \text{birth rate} - \text{death rate}$
- What causes a negative population growth? What causes a positive population growth?  
Negative population growth occurs when the birth rate is less than the death rate  
Positive population growth occurs when the birth rate exceeds the death rate
- Why do the two graphs appear to have a different shape?  
The population growth rate was much slower in the earlier years. The J-curve shows exponential population growth and the graphs are not drawn to the same scale.
- Using a piece of paper, create the following charts:

Country	Birthrate (%)	Death rate (%)	Population Growth 2005	Population Growth 2050	Demographic Transition	Relative Place in Transition	Sketch graph showing Blue & Pink Line
USA	2.06	0.51	0.92	-0.06	1.55	5

of the relationship between environmental pollution and human health is in its infancy The number of substances and  
mixtures that have been identified in uncontrolled hazardous waste sites or that have been in advertently released into the  
environment is large and data on how these substances are modified as they interact with one another as they migrate  
through soil air and water are limited There are also limits on our understanding of how these substances may be ingested  
inhaled or absorbed by people The complexity of possible interactions between biological chemical and physical components  
in a given environment makes it virtually impossible to evaluate the potential for adverse biological effects adequately in the  
laboratory Other more comprehensive methods which provide realistic and interpretable results must be used Many  
scientists believe that humans represent the ultimate sentinel species of a toxic exposure resulting from environmental  
pollution however such exposures may also severely impact environmental health There exists a wide variety of organisms  
in the natural environment that could be used to provide an early warning for potential human health effects as well as to  
indicate adverse ecological effects The issue of effective utilization of sentinel species for environmental monitoring is a  
rapidly developing area of research which has grown in importance during the last decade      *Holt Biology* Rob DeSalle,Holt
