## INFORMATIONAL SCIENCE PASSAGES, WORKSHEETS, VOCABULARY RESEARCH & PROJECT

**Air Pressure: Feeling the Weight of the Sky**

Air pressure is the force exerted by the weight of air molecules on a surface. It plays a crucial role in shaping the weather and climate, as well as influencing various natural phenomena. Air pressure is caused by the gravitational pull of the Earth, which pulls air molecules towards its surface, creating a layer of air that exerts force on the atmosphere. At altitude increases, air pressure decreases because there are fewer air molecules above pushing down. This is why mountain climbers often experience lower air pressure at high elevations.

Air pressure is commonly measured using a device called a barometer, which detects changes in atmospheric pressure. High pressure systems, also known as anticyclones, are associated with stable weather conditions. Low pressure systems, or cyclones, often bring clouds, rain, and storms. Weather patterns are influenced by the movement of high and low pressure systems around the Earth.

One of the most common types of barometers is the aneroid barometer, which uses a small, sealed chamber that expands and contracts with changes in air pressure. Another type is the mercury barometer, which uses a column of mercury to measure pressure.

Changes in air pressure can be used to predict weather. For example, a falling barometer often indicates an approaching storm, while a rising barometer suggests clearing weather.
