

The Urinary System

The urinary system is responsible for filtering waste from the blood, maintaining fluid balance, and regulating blood pressure. It consists of the kidneys, ureters, bladder, and urethra.

The kidneys are located in the back of the body, on either side of the spine. They are bean-shaped organs that filter blood and produce urine. The ureters are tubes that carry urine from the kidneys to the bladder.

The bladder is a sac-like organ that stores urine until it is ready to be expelled from the body. The urethra is the tube that carries urine from the bladder out of the body.

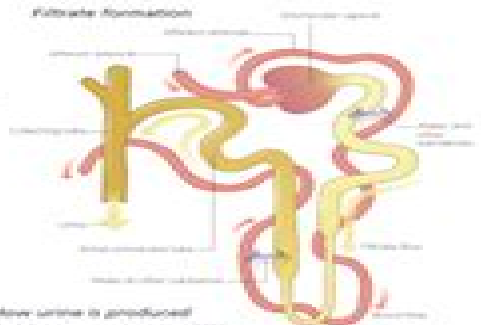

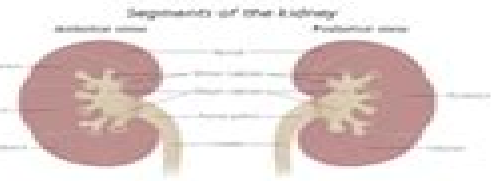

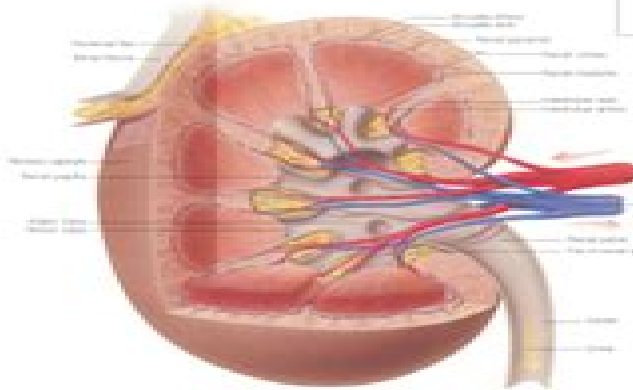

Structure of the kidneys

The kidneys are located in the back of the body, on either side of the spine. They are bean-shaped organs that filter blood and produce urine. The ureters are tubes that carry urine from the kidneys to the bladder.

Functions of the kidneys

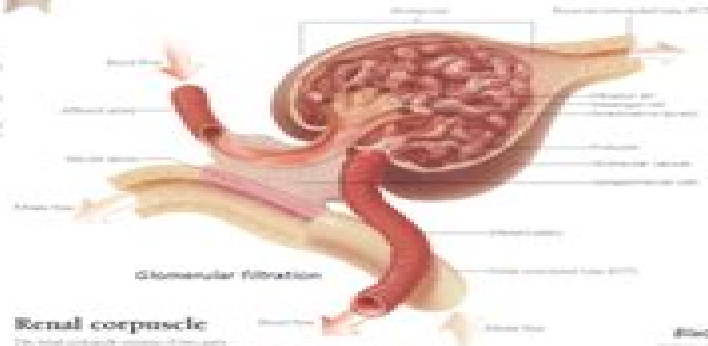

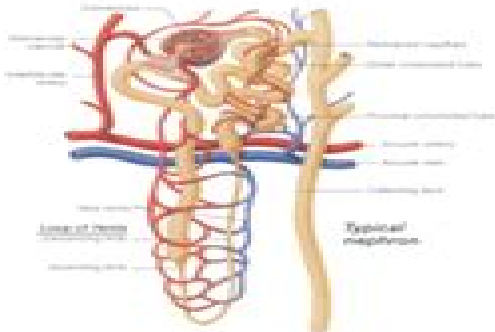

The kidneys have several functions, including filtering waste from the blood, maintaining fluid balance, and regulating blood pressure. They also produce hormones that help regulate the body's metabolism.

The nephron

The nephron is the basic functional unit of the kidney. It is responsible for filtering waste from the blood and producing urine.

A single nephron consists of a renal corpuscle, which is the site of filtration, and a renal tubule, which is the site of reabsorption and secretion.

Renal corpuscle

The renal corpuscle is the site of filtration in the kidney.

The renal corpuscle consists of a glomerulus, which is a cluster of capillaries, and a Bowman's capsule, which is the outer layer of the glomerulus. The glomerulus is located in the upper part of the kidney, and the Bowman's capsule is located in the lower part.

How urine is produced

The kidneys produce about 1.5 liters of urine each day. This process involves filtering blood and removing waste products. The filtered blood then passes through the collecting ducts and is excreted from the body.

- Any stages of urine formation**
- 1. Filtration** - Filtering of water, waste products, salts, glucose, and other chemicals.
- 2. Reabsorption** - Reabsorption of useful substances back to the bloodstream.
- 3. Secretion** - Secretion of waste materials from capillaries into the renal tubule for removal with the urine.
