Low Power Hardware Synthesis from Concurrent Action-Oriented Specifications Gaurav Singh, Sandeep Kumar Shukla, 2010-07-23 Human lives are getting increasingly entangled with technology especially computing and electronics At each step we take especially in a developing world we are dependent on various gadgets such as cell phones handheld PDAs netbooks medical prosthetic devices and medical measurement devices e.g. blood pressure monitors glucometers Two important design constraints for such consumer electronics are their form factor and battery life This translates to the requirements of reduction in the die area and reduced

power consumption for the semiconductor chips that go inside these gadgets Performance is also important as increasingly sophisticated applications run on these devices and many of them require fast response time The form factor of such electronics goods depends not only on the overall area of the chips inside them but also on the packaging which depends on thermal characteristics Thermal characteristics in turn depend on peak power signature of the chips As a result while the overall energy usage reduction increases battery life peak power reduction influences the form factor One more important aspect of these electronic equipments is that every 6 months or so a newer feature needs to be added to keep ahead of the market competition and hence new designs have to be completed with these new features better form factor battery life and performance every few months This extreme pressure on the time to market is another force that drives the innovations in design automation of semiconductor chips

Power Management in Mobile Devices Findlay Shearer, 2011-04-01 Sealed Lead Acid Nickel Cadmium Lithium Ion How do you balance battery life with performance and cost This book shows you how Now that mobile has become the standard the consumer not only expects mobility but demands power longevity in wireless devices As more and more features computing power and memory are packed into mobile devices such as iPods cell phones and cameras there is a large and growing gap between what devices can do and the amount of energy engineers can deliver In fact the main limiting factor in many portable designs is not hardware or software but instead how much power can be delivered to the device This book describes various design approaches to reduce the amount of power a circuit consumes and techniques to effectively manage the available power Power Management Advice On Low Power Packaging Techniques Power and Clock Gating Energy Efficient Compilers Various Display Technologies Linear vs Switched Regulators Software Techniques and Intelligent Algorithms Addresses power versus performance that each newly developed mobile device faces Robust case studies drawn from the author's 30 plus years of extensive real world experience are included Both hardware and software are discussed concerning their roles in power

Reuse Methodology Manual Pierre Bricaud, 2012-12-06 Silicon technology now allows us to build chips consisting of tens of millions of transistors This technology not only promises new levels of system integration onto a single chip but also presents significant challenges to the chip designer As a result many ASIC developers and silicon vendors are re-examining their design methodologies searching for ways to make effective use of the huge numbers of gates now available These designers see current design tools and methodologies as inadequate for developing million gate ASICs from scratch There is considerable pressure to keep design team size and design schedules constant even as design complexities grow Tools are not providing the productivity gains required to keep pace with the increasing gate counts available from deep submicron technology Design reuse the use of pre-designed and pre-verified cores is the most promising opportunity to bridge the gap between available gate count and designer productivity Reuse Methodology Manual for System On A Chip Designs Second Edition outlines an effective methodology for creating reusable designs for use in a System on a Chip SoC design methodology Silicon and tool technologies move so quickly that no single

methodology can provide a permanent solution to this highly dynamic problem. Instead, this manual is an attempt to capture and incrementally improve on current best practices in the industry and to give a coherent integrated view of the design process. Reuse Methodology Manual for System On A Chip Designs Second Edition will be updated on a regular basis as a result of changing technology and improved insight into the problems of design reuse and its role in producing high quality SoC designs.

Low-Power Electronics Design Christian Piguet, 2018-10-03 The power consumption of integrated circuits is one of the most problematic considerations affecting the design of high performance chips and portable devices. The study of power saving design methodologies now must also include subjects such as systems on chips, embedded software, and the future of microelectronics. *Low Power Electronics Design* covers all major aspects of low power design of ICs in deep submicron technologies and addresses emerging topics related to future design. This volume explores in individual chapters, written by expert authors, the many low power techniques born during the past decade. It also discusses the many different domains and disciplines that impact power consumption, including processors, complex circuits, software, CAD tools, and energy sources and management. The authors delve into what many specialists predict about the future by presenting techniques that are promising but are not yet reality. They investigate nanotechnologies, optical circuits, ad hoc networks, e-textiles, as well as human powered sources of energy. *Low Power Electronics Design* delivers a complete picture of today's methods for reducing power and also illustrates the advances in chip design that may be commonplace 10 or 15 years from now.

Low-Power High-Level Synthesis for Nanoscale CMOS Circuits Saraju P. Mohanty, Nagarajan Ranganathan, Elias Kougianos, Priyadarsan Patra, 2008-05-31 *Low Power High Level Synthesis for Nanoscale CMOS Circuits* addresses the need for analysis, characterization, estimation, and optimization of the various forms of power dissipation in the presence of process variations of nano CMOS technologies. The authors show very large scale integration VLSI researchers and engineers how to minimize the different types of power consumption of digital circuits. The material deals primarily with high level architectural or behavioral energy dissipation because the behavioral level is not as highly abstracted as the system level, nor is it as complex as the gate transistor level. At the behavioral level, there is a balanced degree of freedom to explore power reduction mechanisms; the power reduction opportunities are greater and it can cost effectively help in investigating lower power design alternatives prior to actual circuit layout or silicon implementation. The book is a self contained low power high level synthesis text for Nanoscale VLSI design engineers and researchers. Each chapter has simple relevant examples for a better grasp of the principles presented. Several algorithms are given to provide a better understanding of the underlying concepts. The initial chapters deal with the basics of high level synthesis, power dissipation mechanisms, and power estimation. In subsequent parts of the text, a detailed discussion of methodologies for the reduction of different types of power is presented, including Power Reduction Fundamentals, Energy or Average Power Reduction, Peak Power Reduction, Transient Power Reduction, Leakage Power Reduction. *Low Power High Level Synthesis for Nanoscale CMOS Circuits* provides a

valuable resource for the design of low power CMOS circuits **Transaction-Level Power Modeling** Amr Baher Darwish, Magdy Ali El-Moursy, Mohamed Amin Dessouky, 2019-08-01 This book describes for readers a methodology for dynamic power estimation using Transaction Level Modeling TLM The methodology exploits the existing tools for RTL simulation design synthesis and SystemC prototyping to provide fast and accurate power estimation using Transaction Level Power Modeling TLPM Readers will benefit from this innovative way of evaluating power on a high level of abstraction at an early stage of the product life cycle decreasing the number of the expensive design iterations *Embedded and Networking Systems* Gul N.
