Phenology: An Integrative Environmental Science Mark D. Schwartz, 2013-07-30 Phenology refers to recurring plant and animal life cycle stages such as leafing and flowering maturation of agricultural plants emergence of insects and migration of birds It is also the study of these recurring events especially their timing and relationships with weather and climate Phenological phenomena all give a ready measure of the environment as viewed by the associated organism and are thus ideal indicators of the impact of local and global changes in weather and climate on the earth s biosphere Assessing our changing world is a complex task that requires close cooperation from experts in biology climatology ecology geography oceanography remote sensing and other areas Like its predecessor this second edition of Phenology is a synthesis of current phenological knowledge designed as a primer on the field for global change and general scientists students and interested members of the public With updated and new

contributions from over fifty phenological experts covering data collection current research methods and applications it demonstrates the accomplishments progress over the last decade and future potential of phenology as an integrative environmental science

Plant Phenology as a Biomonitor for Climate Change in Germany Gunther Schmidt, Simon Schönrock, Winfried Schröder, 2014-08-14 The investigations refer to the development of plant phenology since the 1960s in Germany Spatiotemporal trends were assessed by means of regression kriging It could be shown that there already is a distinct shift of phenological onset towards the beginning of the year of up to two weeks In future a shift of up to one month was calculated till 2080 Moreover a prolongation of the vegetation period of up to three weeks was found The findings are relevant for the development of mitigation measures to prevent from environmental agricultural and economic issues due to climate change

Terrestrial Ecosystem Research Network TERN is a major initiative of the Australian Government and one of its key areas of investment is to provide funding for a network of long term ecological research plots around Australia LTERN LTERN researchers and other authors in this book have maintained monitoring sites often for one or more decades in an array of different ecosystems across the Australian continent ranging from tropical rainforests wet eucalypt forests and alpine regions through to rangelands and deserts This book highlights some of the temporal changes in the environment that have occurred in the various systems in which dedicated field based ecologists have worked Many important trends and changes are documented and they often provide new insights that were previously poorly understood or unknown These data are precisely the kinds of data so desperately needed to better quantify the temporal trajectories in the environment in Australia By presenting trend patterns and often also the associated data the authors aim to catalyse governments and other organisations to better recognise the importance of long term data collection and monitoring as a fundamental part of ecologically effective and cost effective management of the environment and biodiversity
