This comprehensive book provides a unique overview of advances in the biology and ecology of marine protists Nowadays marine protistology is a hot spot in science to disclose life phenomena using the latest techniques Although many protistological textbooks deal with the cytology genetics ecology and pathology of specific organisms none keeps up with the quick pace of new discoveries on the diversity and dynamics of marine protists in general The book *Marine Protists Diversity and Dynamics* gives an overview of current research on the phylogeny cytology genomics biology ecology fisheries applied sciences geology and pathology of marine free living and symbiotic protists Poorly known but ecologically important protists such as labyrinthulids and apistome ciliates are also presented in detail Special attention is paid to complex interactions between marine protists and other organisms including human beings An understanding of the ecological roles of marine protists is essential for conservation of nature and human welfare This book will be of great interest not only to scientists and students but also to a larger audience to give a better understanding of protists diverse roles in marine ecosystems

Large Meteorite Impacts and Planetary Evolution IV W. U. Reimold, Roger Lawrence Gibson, 2010-01-01 Proceedings of the Fourth International Conference on Large Meteorite Impacts and Planetary Evolution held at the Vredefort Dome South Africa in Aug 2008

The Ioffe Drift Ivar Murdmaa, Elena Ivanova, 2021-10-25 The Discovery of the calcareous Ioffe Drift in the SW Atlantic in 2010 opens new perspectives in the contourite theory Although demonstrating similar behavior relative to bottom water dynamics rather rare and poorly studied calcareous contourites differ from their terrigenous analogs in origin grain size distribution chemical and mineral composition of sedimentary particles The detailed multidisciplinary study of the Ioffe Drift produces new knowledge on biogenic contourites deposited in pelagic realm in conditions of low biological productivity and terrigenous material supply under the influence of the Antarctic Bottom Water flow from the Vema Channel The major

intervals of prevailing erosion are inferred on the drift from 2.51–2.59 to 1.9 Ma and from 1.6 to 0.81 Ma thus indicating strong paleoceanographic changes most likely associated with the reorganization of deep sea circulation and increased bottom water production in the Southern Ocean during the Early Pleistocene and in particular around the Mid Pleistocene Transition
