from Microbes Roberto Mazzoli, Katharina Riedel, Enrica Pessione, 2017-06-02 Microorganisms have had a long and surprising history. They were invisible until invention of microscope in the 17th century. Until that date, although they were extensively but unconsciously employed in food preservation (beer and wine fermentation, cheese, vinegar, yogurt, and bread making) as well as being the causative agents of infectious diseases, they were considered as not existing. The work of Pasteur in the middle of the 19th century revealed several biological activities performed by microorganisms including fermentations and pathogenicity. Due to the urgent issue to treat infectious diseases, the main cause of death at those times, the positive potential of the microbial world has been neglected for about one century. Once the fight against the evil strains was fulfilled, also thanks to the antibiotics industry, began to appreciate bacteria's beneficial characteristics and exploit selected strains as starters for both food fermentations and aroma enzyme and texturing agent production. However, it was only at the end of the 20th century that the probiotic potential of some bacteria, such as lactic acid bacteria and bifidobacteria, was fully recognized. Very recently, apart from the probiotic activity of *in toto* bacteria, attention has begun to be directed to the chemical mediators of the probiotic effect. Thanks also to the improvement of techniques such as transcriptomics, proteomics, and metabolomics, several bioactive compounds are continuously being discovered. Bioactive molecules produced by bacteria, yeasts, and virus-infected cells proved to be important for improving or impairing human health. The most important result of last years' research concerns the discovery that a very complex network of signals allows communication between organisms from intra-species interactions to inter-kingdom signaling. Based on these findings, a completely new approach has arisen: the system biology standpoint. Actually, the different organisms colonizing a certain environmental niche are not merely interacting with each other as individuals but should be considered as a whole complex ecosystem continuously exchanging information at the molecular level. In this context, this topic issue explores both antagonistic compounds (i.e. antibiotics) and multiple function cooperative molecules improving the physiological status of both stimulators and targets of this network. From the applicative viewpoint, these molecules could be hopefully exploited to develop new pharmaceuticals and/or nutraceuticals for improving human health.

Industrial & Mining Standard, 1927 **Injustice** Danny

Dorling, 2015-06-03 In the five years since the first edition of *Injustice*, there have been devastating increases in poverty, hunger, and destitution in the UK. Globally, the richest 1% have never held a greater share of world wealth, while the share of most of the other 99% has fallen in the last five years, with more and more people in debt, especially the young. Economic inequalities will persist and continue to grow for as long as we tolerate the injustices which underpin them. This fully rewritten and updated edition revisits Dorling's claim that Beveridge's five social evils are being replaced by five new tenets of injustice: elitism, efficient exclusion, necessary prejudice, natural greed, and inevitable despair. By showing these beliefs are unfounded, Dorling offers hope of a more equal society. We are living in the most remarkable and dangerous times. With every year that passes, it is more evident that *Injustice* is essential reading for anyone concerned with social
