Footprinting of Nucleic Acid-Protein Complexes, 2014-05-19

Footprinting of Nucleic Acid Protein Complexes provides protocols for studying the stoichiometry, binding site size and location, and structural changes in nucleic acids caused by their interaction with proteins. The methods are central to studying key biological processes such as transcription and translation. The techniques are important to experiments in vivo and in vitro in eukaryotes and in prokaryotes at qualitative and quantitative levels and across many disciplines. This book is a laboratory manual of footprinting techniques for studying nucleic acid-protein interactions. It contains clear and concise descriptions of the most important

methodologies and includes in vivo as well as in vitro applications It is aimed at bench scientists from graduate students on and should be of value in industrial labs as well as in academic settings Use of different footprinting approaches can provide unique insights into DNA protein systems The protocols contained in this handbook are written to be user friendly and thus should be conducive to extending the use of footprinting to new systems The section on quantitative analysis of DNase I footprints should prove especially useful for in depth evaluation of cooperative interactions For the End User Provides clear exposition of footprinting techniques for characterizing DNA protein interactions Covers both protection methods for identifying sites of protein binding and interference methods for determining points of contact between DNA and protein Includes approaches for both in vitro and in vivo measurements High quality timely and of lasting practical value in the laboratory
