

40. Foreword to the test computer

The test computer always indicates the defective assembly (see Fig. 40) which must then be exchanged.

There are always 2 possible sequences:

1. During the test routine, display "F" appears and one or several red lamps light up simultaneously. The test is discontinued and the defective assembly must be exchanged. This exchange is required, because a defective assembly would prevent further testing. The test must be repeated and further indicated assemblies are to be exchanged also.
2. The test sequence is performed to the end, display "E" appears and possibly one or several red lamps light up. If a display is made, the indicated assembly must be exchanged. The test is carried out to the end with display "E" and no error display is indicated, although the machine has a defect. Then, the control circuit board must be exchanged. Afterwards the test is to be repeated.
3. If "E" appears without an error message although the machine has an error, the additional function test must be carried out.

Caution:

In order to avoid damage to the test computer, all connections must always be compared with the text again before inserting the mains lead.

With the help of the test computer, the following components which may have a defect can be traced:
