using the static stress with linear material model The other part of the design which is the pressure pump was also manually calculated The obtained results indicate that the maximum value of the result shows in the bottom of the bottle due to the surface boundary condition The manual calculation of the pressure pump shows that the design just can produce the maximum pressure of about 4 000 Pa While a good manual breast pump should produce at least about 2 000 Pa However the area is not suitable to be reducing in a great number due to the ergonomics condition
