operators since upgrades of the existing narrowband access network will be the critical factor in supplying multimedia broadband services in a competitive market The future broadband access network architecture needs to be flexible enough to efficiently support the provision of a full set of broadband and narrowband services with a wide range of capacity demands A wide range of broadband access technologies are available Furthermore the key issues in the upgrading of the very cost sensitive access network are financial as well as technological both for incumbent and new entrant operators Thus in order to identify minimum risk introductory strategies the economic viability of access network broadband upgrades needs to be carefully assessed However despite the definite need for techno economic evaluations very few books have been published in this field One of the reasons might be that broadband access network upgrading only very recently gained wide recognition as a key challenge for broadband delivery Secondly this kind of strategic work and these studies tend to be considered rather sensitive by operators and thus both results and methodologies are not usually readily available Thirdly the work reported in this book in many respects was a major pioneering effort which quite ambitiously aimed at modelling the whole life cycle costs and revenue streams of access network upgrades as opposed to several other efforts which often are limited to pure investment cost comparisons
