Learning area: Planet Earth and beyond

Theme: The changing Earth

Specific Aim 1: Acquiring knowledge of natural sciences and understanding the damage done by volcanoes.

Activity Sheet

Mass extinctions on Earth may result from a number of causes such as asteroid and comet impacts, rapid climate change (which in turn could lead to sea level changes), sea oxygen level changes, reduced oxygen levels in the atmosphere, changes in the proportion of atmospheric gases such as carbon dioxide, or huge volcanic eruptions.

How and why do volcanic eruptions occur?

In the Earth's centre is a solid core of hot iron and nickel. The hot core melts the rock around it in the outer core and mantle. Hot rock rises and cool rock sinks and convection currents form in the mantle. Where the hot, liquid rock spreads out under the crust it causes the crust to split apart, and lava pours out onto the Earth's surface. Volcanoes occur at the plate margins – where new crust is being formed and where old crust is being forced back down into the mantle, called 'subduction zones'.

Earth is made up of interlocking pieces of land called tectonic plates. As these tectonic plates move, they cause the continents to move. These movements can lead to earthquakes and volcanoes. In the case of volcanoes, extreme heat, creating bubbles of carbon dioxide gas and steam, expands the magma. The expanding gases push the magma into a vent, or opening of a volcano and up to the Earth's surface, causing an explosive volcanic eruption. Once the magma (which is basically molten rock) overflows or erupts out through the Earth's crust, it is called 'lava'.

Some of the larger volcanic eruptions which have occurred on Earth lasted many years, pouring out lava that piled up kilometres deep, killing everything it covered.

Volcanoes also release large amounts of gases into the atmosphere, changing the atmospheric gas balance, and emitting greenhouse gases, which in turn leads to climate change. Climate change then leads to environmental change.

Prentice Hall Physical Science Concepts in Action helps students make the important connection between the science they read and what they experience every day Relevant content lively explorations and a wealth of hands on activities take students understanding of science beyond the page and into the world around them Now includes even more technology tools and activities to support differentiated instruction **Prentice Hall Exploring Earth Science**, 1997 Introduction To Earth Sciences: A Physics Approach (Second Edition) Luc Thomas Ikelle, 2020-04-04

For more than seven decades geophysicists have made significant contributions to the description of solid Earth and deep space based on the physical properties on the exploration and production of the resources deep in the ground and on an understanding and mitigation of the hazards associated with the Earth's dynamics such as volcanic eruptions earthquakes tsunamis landslides hurricanes droughts etc These types of events are so important that they directly affect where we live on the Earth's surface as well as the sources of food energy resources and minerals and such events can affect our very survival Yet most universities still do not have a course focusing on an introduction to geophysics the so called 100 level geophysics course All of the twelve chapters from the first edition have been improved and or expanded In addition to these improvements six new chapters have been added in this second edition The new chapters encompass gravity microgravity earthquake cycle heat variations in the subsurface Earth's magnetic field electricity storage energy prices and a more detailed description of our current understanding of Solar system and the applications of this understanding to life on Earth This new edition can also be used in 100 level physics classes The basic physics of matter is covered in detail along with some highly important problems and questions posed and addressed by modern physics and in Geophysics which is actually a branch of physics Earth Science: the Physical Setting Paola Santagostino, Prentice Hall (School Division), 2005

The Late Eocene Earth Christian Koeberl, Alessandro Montanari, 2009 The Late Eocene and the Eocene Oligocene E O transition mark the most profound oceanographic and climatic changes of the past 50 million years of Earth history with cooling beginning in the middle Eocene and culminating in the major earliest Oligocene Oi 1 isotopic event The Late Eocene is characterized by an accelerated global cooling with a sharp temperature drop near the E O boundary and significant stepwise floral and faunal turnovers These global climate changes are commonly attributed to the expansion of the Antarctic ice cap following its gradual isolation from other continental masses However multiple extraterrestrial bolide impacts possibly related to a comet shower that lasted more than 2 million years may have played an important role in deteriorating the global climate at that time This book provides an up to date review of what happened on Earth at the end of the Eocene Epoch
