

# A Representative Sample and Sampling Error

Topic: Sciences | Words: 324 | Pages: 1

A representative sample is usually several hundred, sometimes a thousand, respondents. Therefore, the starting point for calculating the selection becomes the question of determining the size of the sample population. The larger the sample sizes, i.e., the closer they are to the general population's extent, the more reliable and reliable the data obtained. However, the main problem of the representative sample is the practical impossibility of continuous surveys in those cases when they are carried out at objects, the number of which exceeds tens, hundreds of thousands.

The sampling error may depend not only on its size but also on the degree of differences between individual units within the general population being studied. Thus, the sample size depends on the level of homogeneity or heterogeneity of the studied objects (Woiceshyn & Daellenbach, 2018). The more homogeneous they are, the smaller the number can provide statistically reliable conclusions. The survey technique for solving these problems is to analyze and structure the entire complex of the problem (subject area).

Deductive reasoning is reasoning to which a criterion of validity or logical correctness can be applied. Thus, in this case, the formulation of the problem and the development of the research methodology (formation and approval of the technical task) will become a deductive argument (Hayes et al., 2018). Developing and coordinating with the customer the primary methods of collecting information, including questionnaires, registration forms, and sampling principles, is also a reasoned argument.
