

PLANT REPRODUCTION

Reproduction in Gymnosperms

Gymnosperms are seed-producing plants that do not have a flower and do not have an ovary. They have a separate male and female reproductive system. The male system produces pollen grains, and the female system produces ovules.

The male system consists of stamens, which are made up of anther and filament. The anther produces pollen grains, which are carried by wind to the female system. The female system consists of a single ovule, which is carried by wind to the male system.

The pollen grain has a tube that grows from the anther to the ovule. This tube carries the male gametes to the ovule. The female gamete is released from the ovule and fertilized by the male gamete.

The fertilized ovule develops into a seed. The seed is carried by wind to a new location. The seed germinates and grows into a new plant. This process is called sexual reproduction. It involves the fusion of male and female gametes to form a new individual.

Life Cycle of Gymnosperms

The life cycle of gymnosperms is a continuous cycle that involves the production of pollen grains, the fertilization of ovules, and the growth of a new plant.

The life cycle of gymnosperms is a continuous cycle that involves the production of pollen grains, the fertilization of ovules, and the growth of a new plant. The cycle starts with a mature tree at the top, which produces pollen grains. These grains are carried by wind to a female tree. The female tree produces ovules. The pollen grain fertilizes the ovule, resulting in a seed. The seed is carried by wind to a new location. The seed germinates and grows into a new tree, completing the cycle.
