Clewell,2013-06-29 Bacterial plasmids originating in a wide range of genera are being studied from a variety of perspectives in hundreds of laboratories around the globe These elements are well known for carrying special genes that confer important survival properties frequently necessary under atypical conditions Classic examples of plasmid borne genes are those providing bacterial resistance to toxic substances such as antibiotics metal ions and bacteriophage Often included are those determining bacteriocins which may give the bacterium an advantage in a highly competitive environment Genes offering metabolic alternatives to the cell under nutritionally stressed conditions are also commonly found on plasmids as are determinants important to colonization and pathogenesis It is likely that in many if not most cases plasmids and their passenger determinants represent DNA acquired recently by their bacterial hosts and it is the characteristic mobility of these elements that enables their efficient establishment in new bacterial cells by the process known as conjugation Whereas many

plasmids are fully capable of promoting their own conjugal transfer others move only with help from coresident elements The ability of a plasmid to establish itself in a variety of different species is common and recent studies have shown that transfer can in some cases occur from bacterial cells to eukaryotes such as yeast *Annual Reports of the Secretary for Mines and Industries and the Government Mining Engineer* South Africa.
