Internal Combustion Engine Handbook Richard Van Basshuysen,Fred Schaefer,TechTrans,2016-03-07 More than 120 authors from science and industry have documented this essential resource for students practitioners and professionals Comprehensively covering the development of the internal combustion engine ICE the information presented captures expert knowledge and serves as an essential resource that illustrates the latest level of knowledge about engine development Particular attention is paid toward the most up to date theory and practice addressing thermodynamic principles engine components fuels and emissions Details and data cover classification and

characteristics of reciprocating engines along with fundamentals about diesel and spark ignition internal combustion engines including insightful perspectives about the history components and complexities of the present day and future IC engines Chapter highlights include Classification of reciprocating engines Friction and Lubrication Power efficiency fuel consumption Sensors actuators and electronics Cooling and emissions Hybrid drive systems Nearly 1 800 illustrations and more than 1 300 bibliographic references provide added value to this extensive study Although a large number of technical books deal with certain aspects of the internal combustion engine there has been no publication until now that covers all of the major aspects of diesel and SI engines Dr Ing E h Richard van Basshuysen and Professor Dr Ing Fred Sch fer the editors Internal Combustion Engines Handbook Basics Components Systems and Perspectives *Gear Change Selection and Clutch Control of an Automated Manual Transmission Vehicle* Enric Canal García, 2011 The aim of this report is to provide a detailed overview of Automated Manual Transmissions AMT from its control point of view An introduction about AMT is given stating its main advantages in terms of cost and efficiency compared to other transmission types and justifying the context which makes AMT an interesting system for investigation It is stated as well its importance for the Ford Focus prototype vehicle where the project will carry the investigation This leads to the aim and objectives Then previous research about AMT is summarized Starting with the common problems of AMT some proposed control strategies follow which aim to solve the discussed problems As well AMTs actuator control strategies are presented All this analysis led to some recommendations which guide the next steps of the project Continuing with the vehicle is introduced with major emphasis on the AMT system It is explained the present components and new drivers that are designed and built which provide the functionality needed for the AMT Next the controller architecture development process is discussed Starting from the low level controllers for each of the AMT actuators it is explained the strategy used to achieve the control of them It includes an interesting discussion on how to use the sensors present on the actuators to achieve position control without position feedback Then it follows the details on how each actuator is integrated in high level controllers until achieving the complete control of the AMT successfully Finally some conclusions are drawn stating the importance of the feedback sensors for gearbox controllers and the clutch control concerns Guidance is as well given for further investigation on the AMT system of the prototype vehicle Keywords Gearshift Gearbox Actuators Gearbox Control Clutch Control Shift Shock Shift Time Vehicle Start Simulink Stateflow Synchromesh dSpace *Model-based calibration of automated transmissions* Huang, Hua, 2016-11-18 With continuous restrictions on emission standards and demands for higher driving comfort the calibration of shift quality is linked deeply and widely to automated transmission control algorithms This calibration process is typically implemented with real vehicles on the road under poorly reproducible conditions where the calibration engineer has no other choice but to try different control parameters till the subjective assessment on the shift quality meets certain requirements such as shifting comfort or sportiness Compared with today s multiplying number of variants in vehicle engine transmission combinations and

exponential growth of control parameters this traditional method is backward and costly An efficient way to rise to the challenge is the model based automatic calibration In contrast to the conventional shift quality calibration this novel method uses a closed loop approach based on a dynamic model instead of human know how A shift quality correlated position trajectory is proposed Compared to the traditional control parameter adjustment method the guided trajectory has a higher tolerance to the system's hardware components and a better compatibility with TCUs from diverse suppliers Since shift quality is not restricted to a general summarized grade e.g. comfort and sportiness are always two conflicting influence factors in the terms of shift quality calibrations a multi objective evolutionary algorithm is applied to search the set of Pareto optimal front which includes all the optimal compromised control parameters of the gear shifting trajectory for possible choice In this work a hydro mechanical AMT synchronization system is used as an example to explain the proposed optimization process A Modelica based non linear hydro mechanical AMT system is modeled which describes the transient behavior during gear shifting in detail An effective fuzzy sliding mode position controller is designed for the referenced position tracking during synchronization in contrast to the conventional trial and error tuning method a genetic algorithm is applied to automatically identify and optimize the sliding mode controller parameters A novel multi objective evolutionary algorithm MLIA is developed to find out the optimal control set for the synchronization trajectories Verification at a transmission test bench shows that this model based multi objective optimization method has a guiding capability in automated transmission calibration

Mit deutlich strengeren gesetzlichen Anforderungen hinsichtlich der Abgasemissionen und einer zunehmend anspruchsvolleren Nachfrage bezüglich des Fahrkomforts rückt die Frage nach der Schaltqualität stärker in den Fokus der Getriebeentwicklung Die Kalibrierung umgangssprachlich die Applikation ist deshalb ein Schwerpunkt bei der Entwicklung von Algorithmen für die Schaltqualität von automatisierten Getriebesteuerungen Der Kalibrierungsprozess wird in der Regel im Fahrzeugversuch auf der Straße durchgeführt Der Applikationsingenieur versucht unter diesen nicht reproduzierbaren Bedingungen verschiedene Steuerparameter zu adaptieren Dies wird für eine Schaltung solange durchgeführt bis die subjektive Beurteilung der Schaltqualität und die zugehörigen Eigenschaften wie zum Beispiel Schaltkomfort und Sportlichkeit erfüllt ist Dieser beschriebene Prozess ist zeit und personalaufwendig was mit dem aktuellen Angebot an Motor Getriebe Fahrzeugvarianten kaum bewältigt werden kann Als weitere Herausforderung steigt die Anzahl der kalibrierbaren Parameter der Regler und Steuerungsmethoden stetig um die Kundenbedürfnisse zu befriedigen weshalb auch aus Kostensicht ein besserer Prozess gefunden werden muss Eine effiziente Möglichkeit zur Lösung der skizzierten Problemstellungen ist die modellbasierte automatische Kalibrierung Im Gegensatz zu der herkömmlich auf Fahrversuche basierende Kalibrierung der Schaltqualität verwendet dieses neue Verfahren ein dynamisches Modell in einer geschlossenen Schleife Anstelle des Applikationsingenieurs für die Fahrvorgaben wird in der Schleife ein Fahrerregler und ein Optimierungsalgorithmus verwendet um so eine hohe Reproduzierbarkeit des Schaltereignisses sicherzustellen Es wird

vorgeschlagen die Bewegung der Schaltstellung zu optimieren da diese mit der Schaltqualität korreliert. Diametral steht dem die allgemein übliche Regleranpassung verschiedener Parameter für die Synchronisation gegenüber. Die vorgeschlagene Methode der geführten Schaltbewegung weist eine deutlich höhere Toleranz gegenüber der Varianz an Hardwarekomponenten und damit eine bessere Kompatibilität zu den Getriebesteuergeräten TCUs verschiedener Lieferanten auf. Die Schaltqualität lässt sich nicht auf ein subjektives Kriterium zusammenfassen es werden immer unterschiedliche Faktoren wie z.B. Komfort und Sportlichkeit den Schaltvorgang bestimmen. Deshalb wird für die Optimierung des Schaltvorgangs eine mehrkriterielle evolutionäre Algorithmus angewandt um die Paretofront zu identifizieren was alle Kompromisse der Schaltbewegungsregelung einschließt. Es wird ein Modell eines hydromechanischen Synchronisationssystems für ein automatisiertes Getriebe als Beispielanwendung benutzt um den vorgeschlagenen Optimierungsprozess zu demonstrieren. Das nichtlineare hydromechanische Synchronisationssystem wird mit der objektorientierten Sprache Modelica modelliert. Mit dem Modell werden Schaltvorgänge detailliert beschrieben. Ein Fuzzy Sliding Mode Regler wird für die jeweilige Bewegung der Schaltung während der Synchronisation benutzt. Im Gegensatz zur herkömmlichen empirischen Anpassung der Reglerparameter wird ein genetischer Algorithmus angewendet um die automatische Erkennung und Bewertung der Parameter vom Fuzzy Sliding Mode Regler zu optimieren. Ein neuartiger evolutionärer mehrkriterieller Algorithmus MLIA wurde angewandt um eine optimale Bewegung der Schaltstellung während der Synchronisierung zu finden. Die Validierung am Getriebeprüfstand zeigt dass diese modellbasierte Methode der mehrkriteriellen Optimierung in der automatisierten Getriebekalibrierung eine deutliche Verbesserung darstellt.
