ABSTRACT

There have been a variety of predictive models capable of handling binary targets, ranging from traditional logistic regression to modern neural networks. However, when the target variable represents a rare event, these models might not be appropriate as they assume that the distribution in the target variable is balanced. In this article, the impact of multiple resampling methods on conventional predictive models is studied. These resampling techniques include the methods of oversampling of the rare events, undersampling of the common events in the data, and synthetic minority over-sampling technique (SMOTE). The predictive models of decision trees, logistic regression and rule induction are applied with SAS Enterprise Miner (EM) software to the revised data. The studied data set is of home mortgage applications which includes a target variable with an occurrence rate of the rare event being 0.8%. The authors varied the percentage of the rare event from the original of 0.8% up to 50% and monitored the associated performances of the three predictive models to see which one worked the best.

1. INTRODUCTION

In binary classification, when the proportion of one class in the target variable is significantly smaller than the other class (imbalanced data), one faces the problem of classifying a rare event, or imbalanced classification. Traditional classification modeling techniques such as logistic regression and decision trees generally work quite well with a balanced data. However, with a rare event variable, when the data set is very large, and the event of interest is very small, most of these classification methods typically fail to detect the rare event. This can be particularly true when the percentage of the rare event is extremely small, as in the example presented here, where the rare event occurs in less than 1% of the observations. In this situation, all observations are predicted as being in the group consisting of the more dominant or common event.

First Steps in Data Mining with SAS Enterprise Miner

Martha Abell, 2014-09-06

SAS Enterprise Miner streamlines the data mining process to create highly accurate predictive and descriptive models based on analysis of vast amounts of data from across an enterprise. Data mining is applicable in a variety of industries and provides methodologies for such diverse business problems as fraud detection householding customer retention and attrition database marketing market segmentation risk analysis affinity analysis customer satisfaction bankruptcy prediction and portfolio analysis. In SAS Enterprise Miner the data mining process has the following SEMMA steps Sample the data by creating one or more data sets. The sample should be large enough to contain significant information yet small enough to process. This step includes the use of data preparation tools for data import merge append and filter as well as statistical sampling techniques. Explore the data by searching for relationships trends and anomalies in order to gain understanding and ideas. This step includes the use of tools for statistical reporting and graphical

exploration variable selection methods and variable clustering Modify the data by creating selecting and transforming the variables to focus the model selection process This step includes the use of tools for defining transformations missing value handling value recoding and interactive binning Model the data by using the analytical tools to train a statistical or machine learning model to reliably predict a desired outcome This step includes the use of techniques such as linear and logistic regression decision trees neural networks partial least squares LARS and LASSO nearest neighbor and importing models defined by other users or even outside SAS Enterprise Miner Assess the data by evaluating the usefulness and reliability of the findings from the data mining process This step includes the use of tools for comparing models and computing new fit statistics cutoff analysis decision support report generation and score code management You might or might not include all of the SEMMA steps in an analysis and it might be necessary to repeat one or more of the steps several times before you are satisfied with the results After you have completed the SEMMA steps you can apply a scoring formula from one or more champion models to new data that might or might not contain the target variable Scoring new data that is not available at the time of model training is the goal of most data mining problems Furthermore advanced visualization tools enable you to quickly and easily examine large amounts of data in multidimensional histograms and to graphically compare modeling results
