*Prentice Hall Chemistry*, 2000      **An Introduction to Spectroscopy, Atomic Structure and Chemical Bonding**

Terry L. Meek, 1998 An Introduction to Spectroscopy presents the most fundamental concepts of inorganic chemistry at a level appropriate for first year students and in a manner comprehensible to them This is true even of difficult topics such as the wave mechanical atom symmetry elements and symmetry operations and the ligand group orbital approach to bonding The book contains many useful diagrams illustrating among other things the angular dependence of atomic wave functions the derivation of energy level diagrams for polyatomic molecules close packed lattices and ionic crystal structures The diagrams of the periodic variation of atomic and molecular properties showing trends across periods and down groups simultaneously are especially instructive Spectroscopy is presented mainly as a tool for the elucidation of atomic and molecular structures Each chapter begins with a clear and concise statement of What Every First year Student Should Know About outlining the background knowledge that the student is assumed to have from previous courses and thus pointing out what topics might need to be reviewed There are also detailed statements of the objectives of each chapter a number of worked examples interspersed in the text and a comprehensive set of problems and exercises to test the student s understanding Tables of data throughout the text and appendices at the end provide much valuable information      **A**

Naminosuke Kubota, 2015-04-22 Propellants and Explosives Explosives and propellants are termed energetic materials for containing considerable chemical energy which can be converted into rapid expansion In contrast to simple burning of a fuel

explosives and propellants are self contained and do not need external supply of oxygen via air Since their energy content thus inherently creates the risk of accidental triggering of the explosive reaction proper synthesis formulation and handling during production and use are of utmost importance for safety and necessitate specialist knowledge on energetic materials their characteristics handling and applications Now in its third edition the classic on the thermochemical aspects of the combustion of propellants and explosives is completely revised and updated and includes green propellants as new topic The combustion processes of typical energetic crystalline and polymeric materials and various types of propellants and pyrolants are presented to provide an informative generalized approach for the understanding of the combustion mechanisms of those materials The first half of the book represents an introductory text on pyrodynamics describing fundamental aspects of the combustion of energetic materials The second half highlights applications of energetic materials as propellants explosives and pyrolants with focus on phenomena occurring in rocket motors In addition the appendix gives a brief overview of the fundamentals of aerodynamics and heat transfer which is a prerequisite for the study of pyrodynamics A detailed reference for readers interested in rocketry or explosives technology

**Ultrahigh Vacuum Metalorganic Chemical Vapor Deposition and in Situ Characterization of Nanoscale Titanium Dioxide Films** Polly Wanda Chu,1994 Thin titanium dioxide films were produced by metalorganic chemical vapor deposition on sapphire 0001 in an ultrahigh vacuum UHV chamber A method was developed for producing controlled submonolayer depositions from titanium isopropoxide precursor Film thickness ranged from 0.1 to 2.7 nm In situ X ray photoelectron spectroscopy XPS was used to determine film stoichiometry with increasing thickness The effect of isothermal annealing on desorption was evaluated Photoelectron peak shapes and positions from the initial monolayers were analyzed for evidence of interface reaction Deposition from titanium isopropoxide is divided into two regimes depositions below and above the pyrolysis temperature This temperature was determined to be 300 deg C Controlled submonolayers of titanium oxide were produced by cycles of dosing with titanium isopropoxide vapor below and annealing above 300 deg C Precursor adsorption below the pyrolysis temperature was observed to saturate after 15 minutes of dosing The quantity absorbed was shown to have an upper limit of one monolayer The stoichiometry of thin films grown by the cycling method were determined

to be TiO<sub>2</sub> Titanium dioxide film stoichiometry was unaffected by isothermal annealing at 700 deg C Annealing produced a decrease in film thickness This was explained as due to desorption Desorption ceased at approximately 2.5 to 3 monolayers suggesting bonding of the initial monolayers of film to sapphire is stronger than to itself Evidence of sapphire reduction at the interface by the depositions was not observed The XPS O 1s peak shifted with increased film thickness The shifts were consistent with oxygen in sapphire and titanium dioxide having different O 1s photoelectron peak positions Simulations showed the total shifts for thin films ranging in thickness of 0.1 to 2.7 nm to be 0.99 to 1.23 eV Thick films were produced for comparison

**Chemical Equilibrium** William Guenther, 2012-12-06 The present work is designed to provide a practical introduction to aqueous equilibrium phenomena for both students and research workers in chemistry biochemistry geochemistry and interdisciplinary environmental fields The pedagogical strategy I have adopted makes heavy use of detailed examples of problem solving from real cases arising both in laboratory research and in the study of systems occurring in nature The procedure starts with mathematically complete equations that will provide valid solutions of equilibrium problems instead of the traditional approach through approximate concentrations and idealized infinite dilution assumptions There is repeated emphasis on the use of corrected conditional equilibrium constants and on the checking of numerical results by substitution in complete equations and or against graphs of species distributions Graphical methods of calculation and display are used extensively because of their value in clarifying equilibria and in leading one quickly to valid numerical approximations The coverage of solution equilibrium phenomena is not however exhaustively comprehensive Rather I have chosen to offer fundamental and rigorous examinations of homogeneous step equilibria and their interactions with solubility and redox equilibria Many examples are worked out in detail to demonstrate the use of equilibrium calculations and diagrams in various fields of investigation
