Proceedings of the Third International Scientific Conference “Intelligent Information Technologies for Industry” (IITI’18) Ajith Abraham,Sergey Kovalev,Valery Tarassov,Vaclav Snasel,Andrey Sukhanov,2018-12-05 This book contains papers presented in the main track of IITI 2018 the Third International Scientific Conference on Intelligent

Information Technologies for Industry held in Sochi Russia on September 17-21. The conference was jointly co-organized by Rostov State Transport University, Russia and V. B. Technical University of Ostrava, Czech Republic, with the participation of Russian Association for Artificial Intelligence (RAAI). IITI 2018 was devoted to practical models and industrial applications related to intelligent information systems. It was considered as a meeting point for researchers and practitioners to enable the implementation of advanced information technologies into various industries. Nevertheless, some theoretical talks concerning the state of the art in intelligent systems and soft computing were also included into proceedings.

Block Designs: A Randomization Approach Tadeusz Calinski, Sanpei Kageyama, 2012-12-06. The book is composed of two volumes, each consisting of five chapters. In Volume I, following some statistical motivation based on a randomization model, a general theory of the analysis of experiments in block designs has been developed. In the present Volume II, the primary aim is to present methods that satisfy the statistical requirements described in constructing block designs. Volume I particularly those considered in Chapters 3 and 4, and also to give some catalogues of plans of the designs. Thus, the constructional aspects are of predominant interest in Volume II, with a general consideration given in Chapter 6. The main design investigations are systematized by separating the material into two contents depending on whether the designs provide unit efficiency factors for some contrasts of treatment parameters (Chapter 7) or not (Chapter 8). This distinction in classifying block designs may be essential from a practical point of view. In general classification of block designs, whether proper or not, is based here on efficiency balance (EB) in the sense of the new terminology proposed in Section 4.4. See in particular Definition 4.4.2. Most of the attention is given to connected proper designs because of their statistical advantages as described in Volume I, particularly in Chapter 3. When all contrasts are of equal importance, either the class of $v \geq 1$ or EB designs is

Rate-Quality Optimized Video Coding Yoo-Sok Saw, 2012-12-06. Rate-Quality Optimized Video Coding discusses the matter of optimizing or negotiating the data rate of compressed digital video and its quality, which has been a relatively neglected topic in either side of image video coding and tele-traffic management. Video rate management becomes a technically challenging task since it is required to maintain a certain video quality regardless of the availability of transmission or storage media. This is caused by the broadband nature of digital video and inherent algorithmic features of mainstream video compression schemes, e.g., H.261, H.263, and MPEG series. In order to maximize the media utilization and to enhance video quality, the data rate of compressed video should be regulated within a budget of available media resources while maintaining the video quality as high as possible. In Part I, Chapters 1 to 4, the non-stationarity of digital video is discussed. Since the non-stationary nature is also inherited from algorithmic properties of international video coding standards, which are a combination of statistical coding techniques, the video rate management techniques of these standards are explored. Although there is a series of known video rate control techniques, such as picture rate variation, frame dropping, etc., these techniques do not view the matter as an optimization between rate and quality. From the view of rate quality

optimization the quantizer is the sole means of controlling rate and quality Thus quantizers and quantizer control techniques are analyzed based on the relationship of rate and quality In Part II Chapters 5 and 6 as a coherent approach to non stationary video established but still thriving nonlinear techniques are applied to video rate quality optimization such as artificial neural networks including radical basis function networks and fuzzy logic based schemes Conventional linear techniques are also described before the nonlinear techniques are explored By using these nonlinear techniques it is shown how they influence and tackle the rate quality optimization problem Finally in Chapter 7 rate quality optimization issues are reviewed in emerging video communication applications such as video transcoding and mobile video This chapter discusses some new issues and prospects of rate and quality control in those technology areas Rate Quality Optimized Video Coding is an excellent reference and can be used for advanced courses on the topic *Digital Design Using VHDL* William J. Dally,R. Curtis Harting,Tor M. Aamodt,2016 Provides students with a system level perspective and the tools they need to understand analyze and design complete digital systems using VHDL It goes beyond the design of simple combinational and sequential modules to show how such modules are used to build complete systems reflecting digital design in the real world
