Resources in Education ,1998-07 Monitoring Continuous Phenomena Peter Lorkowski, 2021-06-25 Monitoring continuous phenomena by stationary and mobile sensors has become a common due to the improvement in hardware and communication infrastructure and decrease in its cost Sensor data is now available in near real time via web interfaces and in machine readable form facilitated by paradigms like the Internet of Things IoT There are still some obstacles in the usability of the data since the positions in space and time of observation and the positions of interest usually do not coincide Interpolation is the technique to fill such gaps and there are manifold methods to perform it To actually operate a monitoring system there are problems like unambiguous identification of interpolation method and associated parameters appropriate interface to store observations and retrieve interpolated data continuous update of the interpolation model for real time monitoring compression and progressive retrieval of observational data and critical states definition and notification by using aggregation of values This book proposes a general system architecture that addresses these problems It is not confined to details about particular interpolation methods but rather takes a holistic view on the problem of monitoring State of the art technologies like geostatistics sensor web enablement and field data types are introduced and applied in order to provide a viable toolset for the problem domain The focus is on the overall organization of the monitoring and the architectural design of the software system and the associated simulation framework that is used to systematically evaluate different monitoring approaches The whole cycle of a monitoring entailing observation interpolation discretization storage retrieval and notification is covered Concrete solutions for several common problems in this context are provided **Assessment of the Performance of Engineered Waste Containment Barriers** National Research Council, Division on Earth and Life Studies, Board on Earth Sciences and Resources, Committee to Assess the Performance of Engineered Barriers, 2007-08-22 President Carter's 1980 declaration of a state of emergency at Love Canal New York recognized that residents health had

been affected by nearby chemical waste sites The Resource Conservation and Recovery Act enacted in 1976 ushered in a new era of waste management disposal designed to protect the public from harm It required that modern waste containment systems use engineered barriers designed to isolate hazardous and toxic wastes and prevent them from seeping into the environment These containment systems are now employed at thousands of waste sites around the United States and their effectiveness must be continually monitored Assessment of the Performance of Engineered Waste Containment Barriers assesses the performance of waste containment barriers to date Existing data suggest that waste containment systems with liners and covers when constructed and maintained in accordance with current regulations are performing well thus far However they have not been in existence long enough to assess long term postclosure performance which may extend for hundreds of years The book makes recommendations on how to improve future assessments and increase confidence in predictions of barrier system performance which will be of interest to policy makers environmental interest groups industrial waste producers and industrial waste management industry
