SOME INVESTIGATIONS ON STEGANOGRAPHY TECHNIQUES Dr. V. Nagaraj, 2021-05-20 Steganography is the art of hiding and transmitting data through apparently innocuous carriers in an effort to conceal the existence of the secret data The Least Significant Bit LSB steganography that replaces the least significant bits of the host medium is a widely used technique with low computational complexity and high insertion capacity Although it has good perceptual transparency it is vulnerable to steganalysis which is based on statistical analysis Many other steganography algorithms have been developed such as Discrete Cosine Transform DCT Discrete Wavelet Transform DWT and Spread Spectrum Embedding But the insertion capacities for all the above methods were not satisfied Therefore developing new steganography algorithms against statistical analysis seems to be the prime requirement in steganography The LSB insertion method is the most common and easiest method for embedding messages in an image with high capacity However it is detectable by statistical analysis such as RS and Chisquare analysis Hence researchers are still in look out for steganography techniques with enhanced insertion capacity of secret data along with greater security and which can resist attacks In this work in order to enhance the embedding capacity of secret data four techniques for secret communication have been proposed They are classified into two categories In first category cryptography is used along with steganography to enhance

the security while in second category only steganography is used In the first category two improved LSB substitution techniques have been proposed The first technique is known as Zigzag Modulo Substitution Method in which embedding locations are Sequence based The second technique is known as Random Modulo Substitution Method using Random Technique in LSB Steganography and user key based LSB substitution steganography for RGB images where in RSA algorithm is used for encryption The techniques under the first category are exclusively LSB array based The first LSB array based technique embeds message bits into LSB arrays of cover image by using zigzag scanning On the other hand the Random Modulo Substitution Method embeds secret data into the different locations of cover image by using pseudo random index generator Moreover both these LSB array based techniques use RSA algorithm to enhance security Histogram and Statistical analysis performed on the stego image proved that the proposed techniques can effectively resist steganalysis Comparison of the statistical parameters like Root Mean Square RMS Peak Signal to Noise Ratio PSNR and Structural Similarity Index Matrix SSIM for the proposed techniques with cover image and stego image was carried out and analyzed The Second category includes pixel value modification method and pixel value differencing method in which the embedding decision for a target pixel is taken by random technique Data hiding by using pixel value modification with modulus function in color images guarantees that no pixel value will exceed the range 0 to 255 in stego image In the existing PVD embedding methods only one secret digit was embedded for two consecutive pixels but the proposed method embeds one secret digit in only one pixel Proposed method on color images gives more capacity and security than the PVD methods It also provides better visual quality of stego image Moreover proposed method extracts the hidden secret message efficiently without using the range tables In existing steganography algorithms like Pixel Value Differencing PVD methods the secret data are embedded into the differences of adjacent pixels This pair wise modification mechanism in cover image increases the histogram distortion

4D Visualization of Matter Ahmed H Zewail, 2014-09-12 Ever since the beginning of mankind's efforts to pursue scientific inquiry into the laws of nature visualization of the very distant and the very small has been paramount The examples are numerous A century ago the atom appeared mysterious a raisin or plum pie of no structure until it was visualized on the appropriate length and time scales Similarly with telescopic observations a central dogma of the cosmos was changed and complexity yielded to simplicity of the heliocentric structure and motion in our solar system For matter in over a century of developments major advances have been made to explore the inner microscopic structures and dynamics These advances have benefited many fields of endeavor but visualization was incomplete it was limited either to the 3D spatial structure or to the 1D temporal evolution However in systems with myriads of atoms 4D spatiotemporal visualization is essential for dissecting their complexity The biological world is rich with examples and many molecular diseases cannot be fully understood without such direct visualization as for example in the case of Alzheimer's and Parkinson's The same is true for phenomena in materials science chemistry and nanoscience This anthology is an account of the collected works that have emerged over the past decade from Caltech Through recent publications the volume provides overviews of the principles the electron based techniques and the applications made Thanks to advances in imaging principles and technology it is now possible with 4D electron microscopy to reach ten orders of magnitude improvement in time resolution while simultaneously conserving the atomic spatial resolution in visualization This is certainly a long way from Robert Hooke's microscopy which was recorded in his 1665 masterpiece *Micrographia*

(Science, Technology, Engineering and Mathematics) Tools in Microbiology of Infectious Diseases Julio Alvarez, Andres Perez, 2017-06-02 Epidemiology is a discipline intended to systematically investigate and ideally quantify disease dynamics in populations Perez 2015 Epidemiological assessments may be divided into four large areas namely a identification and characterization of a pathogen b development of systems for detection of cases c descriptive epidemiology and quantification of disease patterns and d advanced analytical methods to design intervention strategies Briefly there is an initial need for understanding the pathogeny of a disease and condition which may also include experimental studies and development of new models of infection and proliferation under different conditions Subsequently such knowledge may be applied to support the identification of cases which typically includes the design evaluation and validation of diagnostic tests Disease may then be quantified in a population leading to the identification of patterns and application of molecular characterization techniques to understand disease spread and ultimately to identify factors preventing or promoting disease Finally those factors may be incorporated into advanced quantitative methods and epidemiological models which are used to

design and evaluate strategies aimed at preventing controlling or eliminating disease in the population Recent years have seen a dramatic increase in the application of science technology engineering and mathematical STEM tools and approaches intended to enhance such analytical epidemiology process with the ultimate goal of supporting disease prevention control and eradication This eBook comprises a series of research articles that through current state of the art scientific knowledge on the application of STEM tools to the microbiology of infectious diseases demonstrate their usefulness at the various components of an integral epidemiological approach divided into the four large components of a experimental studies b novel diagnostic techniques c epidemiological characterization and d population modeling and intervention

Organic Bioelectronics for Neurotransmitter Release at the Speed of Life Theresia Arbring Sjöström, 2020-12-07 The signaling dynamics in neuronal networks includes processes ranging from lifelong neuromodulation to direct synaptic neurotransmission In chemical synapses the time delay it takes to pass a signal from one neuron to the next lasts for less than a millisecond At the post synaptic neuron further signaling is either up or down regulated dependent on the specific neurotransmitter and receptor While this up and down regulation of signals usually runs perfectly well and enables complex performance even a minor dysfunction of this signaling system can cause major complications in the shape of neurological disorders The field of organic bioelectronics has the ability to interface neurons with high spatiotemporal recording and stimulation techniques Local chemical stimulation i e local release of neurotransmitters enables the possibility of artificially altering the chemical environment in dysfunctional signaling pathways to regain or restore neural function To successfully interface the biological nervous system with electronics a range of demands must be met Organic bioelectronic techniques and materials are capable of reaching the demands on the biological as well as the electronic side of the interface These demands span from high performance biocompatible materials to miniaturized and specific device architectures and high dose control on demand within milliseconds The content of this thesis is a continuation of the development of organic bioelectronic devices for neurotransmitter delivery Organic materials are utilized to electrically control the dose of charged neurotransmitters by translating electric charge into controlled artificial release The first part of the thesis Papers 1 and 2 includes further development of the resistor type release device called the organic electronic ion pump This part includes material evaluation microfluidic incorporation and device design considerations The aim for the second part of this thesis Papers 3 and 4 is to enhance temporal performance i e reduce the delay between electrical signal and neurotransmitter delivery to corresponding delay in biological neural signaling while retaining tight dosage control Diffusion of neurotransmitters between nerve cells is a slow process but since it is restricted to short distances the total time delay is

short In our organic bioelectronic devices several orders of magnitude in speed can be gained by switching from lateral to vertical delivery geometries This is realized by two different types of vertical diodes combined with a lateral preload and waste configuration The vertical diode assembly was further expanded with a control electrode that enables individual addressing in each of several combined release sites These integrated circuits allow for release of neurotransmitters with high on off release ratios approaching delivery times on par with biological neurotransmission Computational Mathematics, Nanoelectronics, and Astrophysics Shaibal Mukherjee, Abhirup Datta, Santanu Manna, Swadesh Kumar Sahoo, 2021-03-23 This book is a collection of original papers presented at the International Conference on Computational Mathematics in Nanoelectronics and Astrophysics CMNA 2018 held at the Indian Institute of Technology Indore India from 1 to 3 November 2018 It aims at presenting recent developments of computational mathematics in nanoelectronics astrophysics and related areas of space sciences and engineering These proceedings discuss the most advanced innovations trends and real world challenges encountered and their solutions with the application of computational mathematics in nanoelectronics astrophysics and space sciences From focusing on nano enhanced smart technological developments to the research contributions of premier institutes in India and abroad on ISRO s future space explorations this book includes topics from highly interdisciplinary areas of research The book is of interest to researchers students and practising engineers working in diverse areas of science and engineering ranging from applied and computational mathematics to nanoelectronics nanofabrications and astrophysics
