Engineering Design Michele Maugeri, Claudio Soccodato, 2014-02-03 Pseudo static analysis is still the most used method to assess the stability of geotechnical systems that are exposed to earthquake forces However this method does not provide any information about the deformations and permanent displacements induced by seismic activity Moreover it is questionable to use this approach when geotechnical systems are affected by frequent and rare seismic events Incidentally the peak ground acceleration has increased from 0.2-0.3 g in the seventies to the current value of 0.6-0.8 g Therefore a shift from the pseudo static approach to performance based analysis is needed Over the past five years considerable progress has been made in Earthquake Geotechnical Engineering Design EGED The most recent advances are presented in this book in 6 parts The evaluation of the site amplification is covered in Part I of the book In Part II the evaluation of the soil foundation stability against natural slope failure and liquefaction is treated In the following 3 Parts of the book the EGED for different geotechnical systems is presented as follows the design of levees and dams including natural slopes in Part III the design of foundations and soil structure interaction analysis in Part IV underground structures in Part V Finally in Part VI new topics like the design of reinforced earth retaining walls and landfills are covered **Chemistry and Brain Development**

Rodolfo Paoletti, 2012-12-06 J. Folch Pi Director of Scientific Research McLean Hospital Belmont Mass U S A The development of the central nervous system is possibly the most significant aspect of the growth of a mammal from embryo to adulthood The central nervous system is obviously the main repository not only of the species inherited functional characteristics but also of the process of individuation Whatever engrams constitute the basis of individual characteristics are laid down mainly in the central nervous system and especially the brain during its growth The chemical aspect of this process is clearly of great importance and the significance of its study should be self evident Nevertheless it is only one aspect of a parallel series of morphological physiological biochemical and psychological events which take place as an integrated process the final result of which is the transformation of the post embryonic nervous system into the functioning adult system It is imperative therefore that any study or description of the chemical events during the development of the CNS should be undertaken in full awareness of the concomitant morphological physiological and psychological events It is only against this multidisciplinary

inary informational framework that the chemical events during 2 J FOLCH PI development can be correctly interpreted and acquire their full significance With this in mind the introduction to this volume may best serve its purpose by describing briefly the morphological and physiological events that accompany the chemical aspect of development **Pharmacology**

of Ganglionic Transmission D.A. Kharkevich, 2012-12-06 D A KHARKEVICH The history of the study of ganglionic substances begins with the paper of LANGLEY and DICKINSON 1889 who established the ability of nicotine to block the neurones in the superior cervical ganglion This was a considerable discovery as the authors ascertained that impulses were transmitted from pre to postganglionic neurones in the autonomic ganglia Simultaneously they indicated the possibility of pharmacological influence upon interneuronal transmission in autonomic ganglia The idea of ganglionic receptors specifically sensitive to nicotine followed logically Later LANGLEY 1905 1906 considered the problem of receptors with respect to neuro effector synapses It is remarkable that he was one of the first to put forward the theory of chemical mediation of excitation the nervous impulse should not pass from nerve to muscle by an electric discharge but by the secretion of a special substance at the end of the nerve LANGLEY 1906 p 183 In addition LANGLEY JOHN N LANGLEY 1852 1926 D A KHARKEVICH 2 and his collaborators managed to define the topography of autonomic ganglia more precisely by means of nicotine It should be mentioned that it was he who introduced the terms autonomic nervous system and parasympathetic nervous system **Gas Separation by Adsorption Processes** Ralph T. by Adsorption Processes provides a thorough discussion of the advancement in gas adsorption process The book is comprised of eight chapters that emphasize the fundamentals concept and principles The text first covers the adsorbents and adsorption isotherms and then proceeds to detailing the equilibrium adsorption of gas mixtures Next the book covers rate processes in adsorbers and adsorber dynamics The next chapter discusses cyclic gas separation processes and the remaining two chapters cover pressure swing adsorption The book will be of great use to students researchers and practitioners of disciplines that involve gas separation processes such as chemical engineering *Japanese Multinationals in Europe* Ken-ichi Ando, 2005-01-01 Ando's well researched comparison of Japanese automobile and pharmaceutical investment in Europe not only provides a compelling demonstration of the strategic and organizational diversity of contemporary Japanese multinationals but illustrates the challenges faced by all multinationals by the complex and multi faceted process of European integration Geoffrey Jones Harvard Business School US This book explores the regional strategy and management of Japanese MNEs in Europe Ken ichi Ando investigates using case studies of the auto and pharmaceutical industries how these companies can and do overcome the inherent difficulties and opportunities of trading in Europe including the problems posed by cultural differences and geography alongside the opportunities of expanding markets While these companies are global players they must increasingly be aware of and evolve in response to European economic integration The strategy setting and management are influenced by company and industry specific factors and some common features can be found The

locational and entry strategies are based both on the multinationals own resources and capability and on the changing locational conditions while pan European management is conducted to achieve the benefits of multinationality at the regional level The mutual relationships between the location of subsidiaries the entry mode and the pan European operation are clearly shown from the detailed analysis at the company level The impacts and limits of the EU on multinationals are also confirmed in the book and the importance of national characteristics is suggested Scholars and graduate students studying international business and economics as well as European integration will find this book of great interest
