Algebra: Themes, Tools, Concepts - Teacher Resources , Learning Abstract Algebra with ISETL Ed

Dubinsky, Uri Leron, 2013-12-01 Most students in abstract algebra classes have great difficulty making sense of what the instructor is saying. Moreover, this seems to remain true almost independently of the quality of the lecture. This book is based on the constructivist belief that before students can make sense of any presentation of abstract mathematics, they need to be engaged in mental activities which will establish an experiential base for any future verbal explanation. No less, they need to have the opportunity to reflect on their activities. This approach is based on extensive theoretical and empirical studies as well as on the substantial experience of the authors in teaching abstract algebra. The main source of activities in this course is computer constructions, specifically small programs written in the mathlike programming language ISETL. The main tool for reflections is work in teams of 2-4 students where the activities are discussed and debated. Because of the similarity of ISETL expressions to standard written mathematics, there is very little programming overhead. Learning to program is inseparable from learning the mathematics. Each topic is first introduced through computer activities which are then followed by a text section and exercises. This text section is written in an informed discursive style, closely relating definitions and proofs to the constructions in the activities. Notions such as cosets and quotient groups become much more meaningful to the students than when they are presented in a lecture.

Visual Hydrology Peter A. Mantz, 2004-05-31 One approach to the introduction of computational material to the classroom is to supplement a textbook with modern computer codes. Unfortunately, most codes are expensive, designed for commercial use without source code, and may require special software. Visual Hydrology provides a cheaper and simpler alternative, supplying computational exercises that can be fully assimilated by students and allowing them to activate, understand, and reproduce modern computer code. Visual Hydrology aims to explain the structure of modern object-oriented computer code, provide the source code for worked examples, numerically check the worked examples used in text, show how worked examples can be used with alternative data, describe and reference the underlying theory, provide additional exercises with each worked example, use Microsoft Excel software alone. Requiring only a basic knowledge of Microsoft Excel, this Primer teaches the use of modern and readily available computer code for engineering computation. Visual Hydrology demonstrates codes for common and practical examples used in hydrological engineering and will be a valuable resource to students, research workers, and consulting engineers in the water-related sector. Examples of source code to accompany this publication can be downloaded by clicking [here](#).
