

Diffusion vs. Osmosis

Osmosis: An Eggcellent Example

Introduction: Cells have an outer covering called the cell membrane that is selectively permeable; it has tiny pores or holes that allow objects to move across it. The cell membrane controls what moves in and out of the cell via Passive or Active Transport.

In passive transport, diffusion is the movement of substances like food, oxygen and waste across the membrane from a high to a lower concentration. Osmosis is the movement of water across the membrane from a high to a lower concentration.

In this lab you will be using a shell-less egg to observe osmosis across a selectively permeable membrane.

Facts about the egg:

- An egg is a single cell with its own cell membrane.
- The egg shell is made up of the mineral calcium carbonate. Calcium carbonate dissolves in acids such as vinegar.
- A chicken egg has 88% water in the white and 48% water in the yolk. Overall, a chicken egg is 74% water, which is similar to the ~70% water in typical animal cells. White vinegar is about 95% water and 5% acetic acid (Dewees 2011).

Safety notes: 1. Raw eggs can carry salmonella (harmful bacteria). Be sure to wash your hands after handling the eggs. 2. Handle your egg very carefully so that it does not break.
