Science Citation Index, 1992 Vols for 1964 have guides and journal lists *Gene Regulation* Bert O'Malley, 2012-12-02 Gene Regulation documents the proceedings of the CETUS UCLA Symposium Gene Regulation held in Keystone Colorado in March April 1982 The symposium related gene structure and regulatory sequences to overall genomic organization and genetic evolution It was the first meeting to focus on regulation of eukaryotic gene expression since the maturation in recombinant DNA technology The book is organized into four parts Part I presents studies on the structure of eukaryotic genes including the organization and molecular basis for differential expression of the mouse light chain genes globin gene transcription and RNA processing and the cloning of the human chromosomal $\alpha 1$ antitrypsin gene and its structural comparison with the chicken gene coding for ovalbumin Part II on chromatin structure includes papers on nuclease sensitivity of the ovalbumin gene and its flanking DNA sequences and the relationship of chromatin structure to DNA sequence Part III on gene expression includes papers on the role of poly A in eukaryotic mRNA metabolism and the in vitro transcription of Drosophila tRNA genes Part IV on cellular biology includes studies such as the importance of calmodulin to the eukaryotic cells *Post-Transcriptional Control of Gene Expression in Plants* Witold Filipowicz, Thomas Hohn, 2012-12-06 A recent volume of this series Signals and Signal Transduction Pathways in Plants K Palme ed Plant Molecular Biology 26 1237 1679 described the relay races by which signals are transported in plants from the sites of stimuli to the gene expression machinery of the cell Part of this machinery the transcription apparatus has been well studied in the last two decades and many important mechanisms controlling gene expression at the transcriptional level have been elucidated However control of gene expression is by no means complete once the RNA has been produced Important regulatory devices determine the maturation and usage of mRNA and the fate of its translation product Post transcriptional regulation is especially important for generating a fast response to environmental and intracellular signals This book summarizes recent progress in the area of post transcriptional regulation of gene expression in plants 18 chapters of the book address problems of RNA processing and stability regulation of translation protein folding and degradation as well as intracellular and cell to cell transport of proteins and nucleic acids Several chapters are devoted to the processes taking place in plant organelles

Regulation of Gene Expression Gary H. Perdew, Jack P. Vanden Heuvel, Jeffrey M. Peters, 2008-08-17 The use of molecular biology and biochemistry to study the regulation of gene expression has become a major feature of research in the biological sciences Many excellent books and reviews exist that examine the experimental methodology employed in specific areas of molecular biology and regulation of gene expression However we have noticed a lack of books especially textbooks that provide an overview of the rationale and general experimental approaches used to examine chemically or disease mediated alterations in gene expression in mammalian systems For example it has been difficult to find appropriate texts that examine specific experimental goals such as proving that an increased level of mRNA for a given gene is attributable to an increase in

transcription rates Regulation of Gene Expression Molecular Mechanisms is intended to serve as either a textbook for graduate students or as a basic reference for laboratory personnel Indeed we are using this book to teach a graduate level class at The Pennsylvania State University For more details about this class please visit <http://moltox.cas.psu.edu> and select Courses The goal for our work is to provide an overview of the various methods and approaches to characterize possible mechanisms of gene regulation Further we have attempted to provide a framework for students to develop an understanding of how to determine the various mechanisms that lead to altered activity of a specific protein within a cell Biological Regulation and Development Robert Goldberger, 2012-12-06 The motivation for us to produce a treatise on regulation was mainly our conviction that it would be fun and at the same time productive to approach the subject in a way that differs from that of other treatises We had ourselves written reviews for various volumes over the years most of them bringing together all possible facts relevant to a particular operon virus or biosynthetic system And we were not convinced of the value of such reviews for anyone but the expert in the field reviewed We thought it might be more interesting and more instructive for both author and reader to avoid reviewing topics that anyone scientist might work on but instead to review the various parts of what many different scientists work on Cutting across the traditional boundaries that have separated the subjects in past volumes on regulation is not an easy thing to do not because it is difficult to think of what interesting topics should replace the old ones but because it is difficult to find authors who possess sufficient breadth of knowledge and who are willing to write about areas outside those pursued in their own laboratories For example no one scientist works on suppression per se He may study the structure of suppressor tRNAs in *Escherichia coli* he may study phenotypic suppression of various characters in *Drosophila* he may study polarity in gene expression and so on *Molecular Mechanisms in the Control of Gene Expression* Donald P. Nierlich, W.J. Rutter, C. Fred Fox, 2013-10-22 *Molecular Mechanisms in the Control of Gene Expression* documents the proceedings of the ICN UCLA conference on Molecular Mechanisms in the Control of Gene Expression organized through the Molecular Biology Institute of UCLA held in Keystone Colorado 21-26 March 1976 The conference focused on three topics the action of repressors on specific nucleotide sequences in DNA how DNA and histones are intertwined in eucaryotic chromosomes and in the development of new techniques that appear to lift genes from complex genomes The volume contains 65 chapters organized into nine parts The papers in Part I examine the organization of prokaryotic and eukaryotic chromosomes Part II presents studies on the interaction of RNA polymerase and regulatory molecules with defined DNA sites Parts III and IV focus on RNA polymerases of eukaryotes and the regulation of transcription in eukaryotic systems respectively Part V contains papers dealing with nucleic acid sequences transcription and processing Part VI covers cellular aspects in the study of gene expression Part VII takes up cloning while Part VIII is devoted to genetic analysis through restriction mapping and molecular cloning Finally Part IX summarizes the recent progress reported at the conference and also indicates some of the limitations that can be placed upon interpretation of data

Regulation of Gene Expression in Plants Carole L. Bassett, 2007-02-15 Except for one area of gene expression control plant research has significantly fallen behind studies in insects and vertebrates The advances made in animal gene expression control have benefited plant research as we continue to find that much of the machinery and mechanisms controlling gene expression have been preserved in all eukaryotes Through comparison we have learned that certain aspects of gene regulation are shared by plants and animals i e both contain introns separating the coding regions of most genes and both utilize similar machinery to process the introns to form mature mRNAs Yet there are some interesting differences in gene structure and regulation between plants and animals For example unlike animal genes plant genes are generally much smaller with fewer and smaller introns Regulation of Gene Expression in Plants presents some of the most recent novel and fascinating examples of transcriptional and posttranscriptional control of gene expression in plants and where appropriate provides comparison to notable examples of animal gene regulation *Regulation of Gene Expression in Eukaryotic Cells* Maureen I. Harris, Brad Thompson, 1974 *Translational Regulation of Gene Expression* J. Ilan, 2013-11-11 Eucaryotic Gene Regulation Richard Axel, 2012-12-02 Eukaryotic Gene Regulation covers the aspects and mechanisms of gene regulation of selected eukaryotes such as yeast Drosophila and insect This book is organized into eight parts encompassing 52 chapters The majority of the chapters are presented in an experimental manner containing an abstract methods results and discussion and conclusion This book first gives a short overview of the evolutionary role of interspersion in eukaryotic genes It then presents considerable chapters on control of gene expression in yeast gene mutation and isolation structure and function and analysis Part III focuses on genetic and DNA sequence analysis in Drosophila It includes discussions on allelic complementation and transvection genetic organization histone gene and gene transcription Part IV examines cell lineage gene expression and sequences and protein synthesis of insects sea urchin and mammalian cells This is followed by discussions on structure and expression of specific eukaryotic genes from chicken rat rabbit and human Topics on the transfer of genetic information within and between cells and the structure and function of chromosome are significantly considered in Parts VI and VII Genes evaluated in these sections include heavy chain immunoglobulin light chain beta globin and dihydrofolate reductase Furthermore this book describes the in vitro transcription and the factors involved internal organization and mechanism of assembly of nucleosome and chromatin structure The concluding section focuses on aspects of viral genome expression including gene regulation synthesis processing and alternative RNA splicing Research biologists geneticists scientists teachers and students will greatly benefit from this book **Eukaryotic Gene Regulation**, 1980

Translational Regulation of Gene Expression 2 J. Ilan, 2012-12-06 This book which results from the dramatic increase in interest in the control mechanism employed in gene expression and the importance of the regulated proteins presents new information not covered in Translational Regulation of Gene Expression which was published in 1987 It is not a revision of the earlier book but rather an extension of that volume with special emphasis on mechanism As the reader will discover there

is enormous diversity in the systems employing genes for translational regulation in order to regulate the appearance of the final product the protein. Thus we find that important proteins such as protooncogenes, growth factors, stress proteins, cytokines, lymphokines, iron storage and iron uptake proteins and a panorama of prokaryotic proteins as well as eukaryotic viral proteins are translationally regulated. Since for some gene products the degree of control is greater by a few orders of magnitude than their transcription, we can state that for these genes at least the expression is translationally controlled. Translational regulation of gene expression in eukaryotes has emerged in the last few years as a major research field. The present book describes mechanisms of translational regulation in bacteria, yeast and eukaryotic viruses as well as in eukaryotic genes. In this book we try to provide in depth coverage by including important examples from each group rather than systematically including all additional systems not described in the previous volume.

Regulatory Networks in Plant Development Federico Valverde, Andrew Groover, José M. Romero, 2018-02-15. During their life cycle, plants undergo a wide variety of morphological and developmental changes. Impinging these developmental processes, there is a layer of gene, protein and metabolic networks that are responsible for the initiation of the correct developmental transitions at the right time of the year to ensure plant life success. New omic technologies are allowing the acquisition of massive amount of data to develop holistic and integrative analysis to understand complex processes. Among them, Microarray, Next generation Sequencing (NGS) and Proteomics are providing enormous amount of data from different plant species and developmental stages, thus allowing the analysis of gene networks globally. Besides the comparison of molecular networks from different species is providing information on their evolutionary history, shedding light on the origin of many key genes/proteins. Moreover, developmental processes are not only genetically programmed but are also affected by internal and external signals. Metabolism, light, hormone action, temperature, biotic and abiotic stresses etc. have a deep effect on developmental programs. The interface and interplay between these internal and external circuits with developmental programs can be unraveled through the integration of systematic experimentation with the computational analysis of the generated omics data. Molecular Systems Biology. This Research Topic intends to deepen in the different plant developmental pathways and how the corresponding gene networks evolved from a Molecular Systems Biology perspective. Global approaches for photoperiod, circadian clock and hormone regulated processes, pattern formation, phase transitions, organ development etc. will provide new insights on how plant complexity was built during evolution. Understanding the interface and interplay between different regulatory networks will also provide fundamental information on plant biology and focus on those traits that may be important for next generation agriculture.

Control of Plant Gene Expression Desh Pal S. Verma, 1993. Control of Plant Gene Expression is a comprehensive volume describing the regulation and control of specific plant genes expressed in different tissues during plant development. It addresses several fundamental aspects of plant gene regulation including signal transduction mechanisms and the role of plant hormones. It also discusses the structure and

regulation of important metabolic genes such as those involved in nitrogen and carbon assimilation lipid biosynthesis and secondary metabolism The book provides excellent examples of genetic engineering applications to alter agronomically important traits making it an essential reference volume for plant molecular biologists and plant biotechnologists It also contains a wealth of information that will be valuable to students specializing in plant molecular biology plant development gene regulation in plants molecular plant physiology or plant biotechnology

Gene Expression and Regulation in Mammalian Cells Fumiaki Uchiumi, 2018-02-28 Sixty years after the central dogma great achievements have been developed in molecular biology We have also learned the important functions of noncoding RNAs and epigenetic regulations More importantly whole genome sequencing and transcriptome analyses enabled us to diagnose specific diseases This book is not only intended for students and researchers working in laboratory but also physicians and pharmacists This volume consists of 14 chapters divided into 4 parts Each chapter is written by experts investigating biological stresses epigenetic regulation and functions of transcription factors in human diseases All articles presented in this volume by excellent investigators provide new insights into the studies in transcriptional control in mammalian cells and will inspire us to develop or establish novel therapeutics against human diseases

Environmental Stress and Gene Regulation Kenneth B. Storey, 1999 Environmental physiology and comparative biochemistry are shifting to a new level of focus the gene New developments in molecular biology have put simplified techniques for screening and analysis of gene expression into the hands of physiologists and biochemists who are using these for novel explorations of organismal responses to environmental stress Selected topics cover both animal and plant systems to focus on recent advances in gene expression responses to environmental stresses including low and high temperature freezing oxygen limitation reactive oxygen species nutrient restriction as well as environmentally cued programmed cell death The book highlights the latest techniques and approaches for exploring the regulation of gene expression and illustrates in selected systems the

interactions between genes and environmental stress that underlie adaptive responses
