Drug Fundamentals, Plus the Most Frequently Prescribed Drug Classifications—including Indications, Reactions, Examples & More

## definitions

- pharmacodynamics** Study of the mechanisms of action of drugs within the body and how drugs produce their effects in the body
- pharmacogenetics** Study of drug reactions in the body that are unanticipated or unusual, and may have a hereditary basis for the response
- pharmacokinetics** Study of drug actions as they move through the body; the way the body absorbs, distributes, metabolizes and excretes drugs; mathematical study of drugs based on time and dose
- pharmacology** Study of biologically active compounds, how they react in the body and how the body reacts to them
- pharmacotherapeutics** Study of drugs used to prevent, treat or diagnose disease
- pharmacy** Preparation and dispensing of drugs
- toxicology** Study of harmful or poisonous effects of drugs

## drug names

## pharmacodynamics

- Receptors**
  - Protein molecules with one or more binding sites, located on cell membranes
- Receive a signal from the body's chemicals: neurotransmitters, hormones, enzymes
- Signal will cause a molecular event on the inside of the cell to occur
- Drugs Enhance (agonists), diminish (partial agonists) or block (antagonists) the generation, transmission or reception of the signal
- Affinity: Attraction between a drug and a receptor
- High affinity: Drug will bind easily to the receptor
- Low affinity: Requires a higher concentration of the drug to get a therapeutic response
- Drug Potency**
  - Amount of drug required to produce a therapeutic response
- Dose Response Curve**
  - Effective Dose (ED<sub>50</sub>): Amount of drug that produces a therapeutic response in 50% of the people taking it
  - Toxic Dose (TD<sub>50</sub>): Amount of drug that produces adverse effects in 50% of the people taking it
  - Therapeutic Index (TI): Margin of safety; ratio between the TD and the ED
  - The higher the TI, the safer the drug is considered to be; in general, nonprescription drugs have much higher TIs than prescription drugs

## pharmacokinetics

- Routes drugs take to get into the body**
  - Oral**
    - Enters the body through the GI tract
    - Taken by mouth, through the rectum, under the tongue or held in the cheeks
  - Intravenous**
    - Enters the body through a different means (i.e., other than the GI tract)
    - Can be injected into the veins, arteries, muscles, spinal cord, or under the skin, inhaled through the lungs, transdermally through the skin via ointment or patch
- Absorption**
  - Bioavailability**: Percent absorbed into systemic circulation after administration
  - Bioavailability** depends on route of administration as well as the drug's ability to cross membranes and reach its target
  - First Pass Effect**
    - Drugs absorbed through the stomach and small intestine must pass through the liver before circulating systemically
    - Liver can inactivate the drug, making less of the drug available to reach the target organ
  - Absorption at cellular level occurs through passive transport, active transport, pinocytosis and facilitated diffusion
- Distribution**
  - Influenced by several factors:
    - Tissue permeability**: Ability of drug to pass through the membranes readily affects the extent to which the drug moves around in the body
    - Blood flow**: Drugs in the blood stream, will get to the organs and tissues that are highly perfused
    - Plasma proteins binding**: Drug can bind to a protein that will render the drug inactive; only an unbound drug can attach to the receptors
    - Binding to subcellular components
    - Blood pH
- Drug Storage Sites**
  - Adipose Tissue**: Primary site; lipid-soluble drugs tend to remain for long periods of time due to low metabolic rates of drugs and poor blood perfusion of tissue
  - Some Toxic agents** like heavy metals
  - Muscle**: Binding can cause muscle to store drugs
  - Chemo**: Liver and kidneys
- Metabolism**
  - Biotransformation**: Chemical changes that occur in the drug following administration
  - Metabolite**: Altered version of the chemical compound
  - Can have a higher or lower rate of activity than the original drug; if higher, drug is given as an inactive or prodrug form
  - Prodrug**: Requires metabolism or activation of drug in order for it to act within the body
- Excretion**
  - First order**: Rate of removal of drug from the body is proportional to the concentration of the drug in the plasma
  - Half-life**: Time required to decrease the blood levels of a drug by one-half
  - A one-time drug dosage will be eliminated almost completely by 5 half-lives
  - A drug given on a continuous dosage schedule will reach steady state concentration after 5 half-lives
  - Steady state**: Rate of drug administration is equal to the rate of drug excretion
  - Organs that excrete drugs: Kidneys, lungs, sweat glands, mammary glands, salivary glands, skin and GI tract

## schedule drugs

- | Schedule Class    | Characteristics  | Examples (C-I to C-IV)   |
|-------------------|--|--|
| Schedule 1: C-I   | High abuse potential; not legal; no acceptable medical use; no prescriptions available   | Heroin, LSD, cocaine, marijuana, methaqualone                        |
| Schedule 2: C-II  | High abuse potential and severe dependence liability; current, accepted medical use; prescription drug signed; not stamped prescription; 30-day supply; no refills                                   | Opium, morphine, coca, methadone                                     |
| Schedule 3: C-III | Less abuse potential, low-moderate physical dependence, high psychological dependence; by prescription only, expires within 6 months; max. 3 refills on one script                                   | Amphetamine, codeine, barbiturates, Valium, Xanax, anabolic steroids |
| Schedule 4: C-IV  | Less abuse potential than C-II drugs; accepted medical use; limited physical and psychological dependence; written or verbal prescription, expires in 6 months; max. 3 refills on one script         | Clonidine, hydralazine, meperidine, pentobarbital, phenobarbital     |
| Schedule 5: C-V   | Limited abuse potential, accepted medical use; small amounts of narcotics used as antitussives (cough medicine) or antidiarrheals; may not need a prescription but must be recorded as a transaction |  |
