Go to: <https://phet.colorado.edu/> Click on the arrow, DOWNLOAD, OPEN and RUN the MOLECULE POLARITY program. Or google "phet molecule polarity" to find the simulation.

## **Introduction:**

In this atomic level simulation, you will investigate how atoms' **electronegativity** values affect the bonds they produce. When two atoms form a covalent bond, a pair of electrons is shared between atoms. **Electronegativity** is a measure of a single atom's ability to attract electrons shared in that bond. In this lab you will work at your own pace, to answer a number of questions. To begin, from what you've already learned about the protons and electrons in an atom, what would cause an atom to have a **high** electronegativity value?

Why might an atom have a low electronegativity value?

## **Procedure:**

**Two Atoms**

- Turn on (check) all view options. **distill** cool the molecule with your mouse.
- Take your time and investigate how the binary compound's bond behaves when the atom's electronegativity and orientation are changed. **Do not rush through this step.** Describe the bond formed between two atoms with similar, low electronegativities.

Describe the bond formed between two atoms with similar, high electronegativities.

Describe the bond formed between two atoms with very different electronegativities.

Describe (in your own words) what is meant by partial charges,  $\delta^-$  and  $\delta^+$ .

$\delta^-$  represents: \_\_\_\_\_

$\delta^+$  represents: \_\_\_\_\_

What happens when the electric field is applied to a very polar molecule?

Why do you think this is? \_\_\_\_\_
