

Learning Goal

To understand how the trajectory of an object depends on its initial velocity, and to understand how air resistance affects the trajectory.

For this problem, use the PHET simulator Projectile Motion. The simulation allows you to fire an object from a cannon, set its trajectory, and measure its range and hang time (the amount of time it is in the air).

Start the simulation. Press Play to launch an object. You can choose the object by clicking on one of the objects in the simulation menu, adjust the cannon barrel to fire along the ground. To adjust the cannon barrel's angle, click and drag on θ or use its slider value (if displayed). You can also adjust the speed, mass, and a portion of the drag by typing in values. **Setting the Resistance** has two settings for γ (one for $\gamma = 0$ and one for $\gamma > 0$). For this problem, you will use an air drag of zero (you will use the drag coefficient on automatically set when the object is chosen).

Play around with the simulation. When you are done, click Done and record your answers to the following Part A. Leave the Resistance unchanged.

Part A

First, you will change your velocity vector. The kinematics equation for vertical motion (ignoring air resistance) is given by

$$y(t) = y_0 + v_0 t - \frac{1}{2} g t^2,$$

where $y_0 = 0$ is the initial position (what is g ?), $y(t)$ is the ground level to the object at the cannon, v_0 is the initial speed, and g is the acceleration due to gravity.

Shoot the baseball straight upward at an angle of 90° (with an initial speed of 20 m/s).

How long does it take for the baseball to hit the ground?

Express your answer with the appropriate units.
