Conservation and biodiversity of protists The conservation of biodiversity is not just an issue of plants and vertebrates It is the scarcely visible invertebrates and myriads of other microscopic organisms that are crucial to the maintenance of ecological processes on which all larger organisms and the composition of the atmosphere ultimately depend Biodiversity and Conservation endeavours to take an holistic view of biodiversity and when the opportunity arises to issue collections of papers dealing with too often neglected groups of organisms The protists essentially eukaryotes that cannot be classified in the kingdoms of animals fungi or plants include some of the least known groups of organisms on earth They are generally treated as a separate kingdom commonly named Protista or Protoctista in textbooks but in reality they are a mixture of organisms with disparate attributes Some authors have hypothesized that the numbers of protists are not especially large and that many have extraordinarily wide distributions However the picture that unfolds from the latest studies discussed in this issue is different There are many species with wide ranges and proportionately more cosmopolitan species than in macroorganism groups as a result of their long evolutionary histories but there are also definite patterns and geographical restrictions to be found Further some protists are linked to host organisms as mutualists or parasites and necessarily connected to the distributions of their hosts      *Prentice Hall Science*, 1993      *The HS&T a Holt Rinehart & Winston*, Holt, Rinehart and Winston Staff, 2004-02
