M. Besser,Luciano Martini,2013-10-22 Clinical Neuroendocrinology Volume II discusses neuroendocrine science and its

application to the analysis of human physiology and behavior This book stresses the importance of the interrelationships between central and peripheral signals neurotransmitters and neuromodulators and target glands and peripheral tissues to ensure coordination of somatic and behavioral development and function The centralist concepts of the importance of brain hormones are revised in this text emphasizing that neurohumoral factors isolated from brain tissues and initially considered to be primarily involved in the central nervous system regulation of the endocrine system also exist outside the brain and spinal cord This volume is valuable to neuroendocrinologists but is also a good source for those involved in basic and clinical research and patient management

Coping with the Environment Bruce S. McEwen, 1998 This unique volume provides fresh insights into the neuroendocrine systems that enable individuals to cope with their physical and social environments Since the pioneering work of Claude Bernard and Walter Cannon on homeostasis and Hans Selye and John Mason on stress there have been profound advances in biomedicine and the regulation of gene expression has emerged as a major theme in connecting nature with nurture With this has come an appreciation of the long time frame in which the environment produces both adaptive and maladaptive changes in an individual organism during the lifespan Indeed experiences early in life can have a life long impact and advances in behavioral and social sciences have interfaced with biology to reveal that the psychosocial environment shapes life long patterns of neuroendocrine function and behavior thus influencing physical and mental health This book begins by discussing the two main stress mediators the catecholamines and the hypothalamic pituitary adrenal axis It then deals with the neurobiology of fear stress and coping and with biological aspects of stress and coping during the life course Next it considers diurnal rhythms sleep and immune defense mechanisms Finally it discusses stress and coping in the social environment in both animal models and humans The book should provide an intellectual framework for further integration of social psychological and biological sciences around basic concepts in physiology
