## **Neurotoxins Volume Neurotoxins:**

Handbook of Neurotoxicology Edward J. Massaro, 2001-11-12 Neurotoxicology is a broad and burgeoning field of research. Its growth in recent years can be related in part to increased interest in and concern with the fact that a growing number of anthropogenic agents with neurotoxic potential including pesticides, lead, mercury, and the polycyclic byproducts of combustion and industrial production continue to be spewed into and accumulate in the environment. In addition, there is great interest in natural products including toxins as sources of therapeutic agents. Indeed, it is well known that many natural toxins of broadly differing structure produced or accumulated for predatory or defensive purposes and toxic agents accumulated incidentally by numerous species function to perturb nervous tissue. Components of some of these toxins have been shown to be useful therapeutic agents and/or research reagents. Unfortunately, the environmental accumulation of some neurotoxic agents of anthropogenic origin, especially pesticides and metals, has resulted in incidents of human poisoning, some of epidemic proportion and high levels of morbidity and mortality. Furthermore, an increasing incidence of neurobehavioral disorders, some with baffling symptoms, is confronting clinicians. It is not clear whether this is merely the result of increased vigilance and/or improved diagnostics or a consequence of improved health care. In any case, the role of exposure to environmental and occupational neurotoxic agents in the etiology of these phenomena, as well as neurodegenerative diseases, is coming under increasing scrutiny and investigation.

**Clostridial Neurotoxins** Cesare Montecucco, 2013-11-11 Tetanus has been known from the very beginning of medical literature since it was first described by Hippocrates of Cos in the fifth century B.C. For 24 centuries it was considered a neurological disease until the breakthrough of CARLE and RATIONE 1884 who demonstrated its infectious etiology. Following the establishment of purified cultures of *Clostridium tetani* KITASATO 1889, FABER 1890, and TIZZONI and CATIANI 1890 demonstrated that the disease is actually an intoxication caused by a proteic neurotoxin. This toxin was shown by BRUSHCHETIINI 1892 to move retroaxonally and to act at the spinal cord level. Soon thereafter VAN ERMINGEN 1897 demonstrated that botulism is also due to intoxication with a protein toxin produced by bacteria of the genus *Clostridium*. These bacteria and their spores are ubiquitous, and the majority of them do not produce neurotoxins. The selective advantage of producing such potent toxin is still a matter of speculation (see Popoff this volume). The next major advance was the discovery that tetanus neurotoxin 1 can be converted by formaldehyde treatment to a nonpathogenic but still fully immunogenic form and that this can be used successfully as a vaccine to prevent tetanus (RAMON and DESCOMBEY 1925). Similar vaccines (toxoids) can be prepared with botulism neurotoxins (see MIDDLEBROOK and BROWN this volume). The prevention of tetanus by vaccination (see Galatzka and Gasse this volume) is one of the great successes of basic research coupled with an efficient public medicine service.

**Handbook of Proteolytic Enzymes, Volume 1** Alan J. Barrett, J. Fred Woessner, Neil D. Rawlings, 2012-12-02 Handbook of Proteolytic Enzymes Second Edition Volume 1 Aspartic and Metallo Peptidases is a compilation of numerous progressive research studies on proteolytic enzymes This edition is organized into two main sections encompassing 328 chapters This handbook is organized around a system for the classification of peptidases which is a hierarchical one built on the concepts of catalytic type clan family and peptidase The concept of catalytic type of a peptidase depends upon the chemical nature of the groups responsible for catalysis The recognized catalytic types are aspartic cysteine metallo serine threonine and the unclassified enzymes while clans and families are groups of homologous peptidases Homology at the level of a family of peptidases is shown by statistically significant relationship in amino acid sequence to a representative member called the type example or to another member of the family that has already been shown to be related to the type example Each chapter discusses the history activity specificity structural chemistry preparation and biological aspects of the enzyme This book will prove useful to enzyme chemists and researchers
