CARBURETTORS

## CARBURETTOR Type 34 ICH

Fig. 1

Fig. 2

### NORMAL RUNNING - Fig. 1.

The fuel, through the needle valve (1) passes to the bowl (18) where the float (19), articulated in the trunnion (21), regulates the needle opening (22) in order to keep the level of the liquid constant: the needle (2) is connected to float tab (19) by means of the return hook (20).

From the bowl (18), through the main jet (17), the fuel reaches the well (15) along duct (16). Mixed with air from the orifices of the emulsifying tube (14), and the air corrector jet (4), through the nozzle (10), it reaches the carburation area, consisting of the auxiliary venturi (11), and the choke (12).

### Technical description and operation of power valve enrichment

Technically the 34 ICH is a single barrel down-draught carburettor equipped with manual choke. It is moreover provided with a power valve device which permits results in terms of consumption and pollution to be obtained without influencing vehicle wide open throttle performance.

The device consists of a valve which operates on the main air correction circuit and is controlled by a spring loaded diaphragm sensitive to manifold vacuum. During part-throttle operation the manifold vacuum exceeds the diaphragm spring load and holds the valve open introducing an air by-pass to the air correction limiter bush.

**Under this condition the mixture strength is leanest possible, resulting in lower fuel consumption and reduced levels of unburnt fuel.**

At wide open throttle the mixture strength must be richer (to obtain maximum power) during the wide open throttle condition the diaphragm spring overcomes the low manifold vacuum and closes the by-pass air circuit. The main fuel circuit air supply is now only available via the correction limiter bush whose diameter is less than the main air corrector. This results in a richer mixture whose strength is correct for wide open throttle operation.
