**Manual of Grasses for North America** Mary E. Barkworth, Laurel K. Anderton, Kathleen M. Capels, Sandy Long, Michael B. Piep, 2007-09-15 Grasses are the world's most important plants. They are the dominant species over large parts of the earth's land surface, a fact that is reflected in the many different words that exist for grasslands: words such as prairie, veldt, palouse, and pampas, to mention just a few. As a group, grasses are of major ecological importance as soil binders and providers of shelter and food for wild animals, both large and small. Some grasses, such as wheat, rice, corn, barley, rye, tef, and sugar cane, are major sources of calories for humans and their livestock; others, primarily bamboos, are used for construction, tools, paper, and fabric. More recently, the seed catalogs that tantalize gardeners each winter have borne witness to an increasing appreciation of the aesthetic value of grasses. The *Manual of Grasses for North America* is designed as a successor to the classic volume by Hitchcock and Chase. It reflects current taxonomic thought and includes keys, illustrations, and distribution maps for the nearly 900 native and 400 introduced species that have been found in North America north of Mexico. In addition, it presents keys and illustrations for several species that are known only in cultivation or are of major agricultural significance, either as progenitors of bread wheat and corn or as a major threat to North American agriculture because of their ability to hybridize with crop species. The *Manual of Grasses for North America* is a major reference work for grasses that will retain its value for many years. [The Digital Jepson Manual](#) Bruce G. Baldwin, Douglas Goldman, David J. Keil, Robert Patterson, Thomas J. Rosatti, 2012-02-07 The second edition of *The Jepson Manual* thoroughly updates this acclaimed work, the single most comprehensive resource on California's amazingly diverse flora. This work integrates the latest science, the results of intensive fieldwork, institutional collaboration, and the efforts of hundreds of contributing authors into an essential reference on California's native and naturalized vascular plants. For the first time, the University of California Press is offering this resource as an e-book. *The Digital Jepson Manual* provides an unparalleled new level of interactivity, portability, and convenience. Extensive linking and e-book friendly illustrations make it easier for users to learn about plant characteristics and identify the native and naturalized plants of California, all in a format ideally suited for use in the field. Using readily available e-book readers, field researchers, students, and enthusiasts can click on links to rapidly navigate through keys to families, genera, species, and subspecies or varieties. Specific features of *The Digital Jepson Manual* include the following: Keys link forward and backward to other taxonomic levels; Plate references in taxonomic treatments link to plates for rapid reference; Plate captions link to taxonomic treatments; Individual taxon figures appear next to species descriptions, and full plates are gathered in a special section; Glossary terms link to any relevant illustrations; List of families links each family to its taxonomic treatment; Index is fully linked to taxonomic treatments. [Skyline](#), 1928 *Rational Transmitting Boundaries for Time-Domain Analysis of Dam-Reservoir Interaction* Benedikt Weber, 2013-06-29 Most existing arch dams have been designed for seismic loading by static methods involving the use of seismic coefficients. Although there

are no known examples of arch dams which have been seriously damaged by earthquakes the need for more realistic seismic analyses is now well recognized not only for new dams but especially in the context of the safety evaluation of existing dams Fortunately with the finite element method engineers have a powerful tool for modeling the complex geometry and the nonlinear material behavior of a dam However there is still a major complication in the analysis procedure namely the interaction of the dam with the reservoir and with the foundation during an earthquake Interaction is a wave propagation problem involving transmitting boundaries The State of the Art in engineering practice is to neglect wave propagation by modeling the water as incompressible and the foundation as massless More advanced analysis methods using compressible water and foundation with mass have been available for some time However these methods are restricted to linear models because they work in the frequency domain On the other hand there are also advanced nonlinear models for dams but they can only be used in the time domain usually with simple transmitting boundaries In this report which is based on an a doctoral thesis rigorous transmitting boundaries in the time domain are developed which permit combining compressible water with a linear dam behavior The new numerical model is based on a systems theory approach
